# TEST REPORT

FCC Test for  
HRDU\_Cband\_M\_R

## REPORT NO.

HCT-RF-2305-FC003

## DATE OF ISSUE

May 02, 2023

## Additional Model

-

## Applicant

### SOLiD, Inc.

10, 9th Floor, SOLiD Space, Pangyoyeok-ro 220,  
Bundang-gu, Seongnam-si, Gyeonggi-do, 463-400, South Korea

## Eut Type Model Name

HRDU  
HRDU\_Cband\_M\_R

## FCC ID

W6UNHCBANDMR

## Output Power

SISO: 45 dBm  
MIMO: 48 dBm

## Date of Test

March 27, 2023 ~ May 02, 2023

## FCC Rule Parts:

CFR 47 Part 2, Part 27

The result shown in this test report refer only to the sample(s) tested unless otherwise stated.  
This test results were applied only to the test methods required by the standard.

## REVISION HISTORY

The revision history for this test report is shown in table.

| Revision No. | Date of Issue | Description     |
|--------------|---------------|-----------------|
| 0            | May 02, 2023  | Initial Release |

The measurements shown in this report were made in accordance with the procedures indicated, and the emissions from this equipment were found to be within the limits applicable. I assume full responsibility for the accuracy and completeness of these measurements, and for the qualifications of all persons taking them. It is further stated that upon the basis of the measurements made, the equipment tested is capable of operation in accordance with the requirements of the FCC Rules under normal use and maintenance.

If this report is required to confirmation of authenticity, please contact to [www.hct.co.kr](http://www.hct.co.kr)

## 2. FACILITIES AND ACCREDITATIONS

### 2.1. FACILITIES

The SAC(Semi-Anechoic Chamber) and conducted measurement facility used to collect the radiated data are located at the 74, Seoicheon-ro 578beon-gil, Majang-myeon, Icheon-si, Gyeonggi-do, 17383, Rep. of KOREA.

The site is constructed in conformance with the requirements of ANSI C63.4 (Version: 2014) and CISPR Publication 22.

Detailed description of test facility was submitted to the Commission and accepted dated April 02, 2018 (Registration Number: KR0032).

### 2.2. EQUIPMENT

Radiated emissions are measured with one or more of the following types of linearly polarized antennas: tuned dipole, bi-conical, log periodic, bi-log, and/or ridged waveguide, horn. Spectrum analyzers with pre-selectors and quasi-peak detectors are used to perform radiated measurements.

Calibrated wideband preamplifiers, coaxial cables, and coaxial attenuators are also used for making measurements.

All receiving equipment conforms to CISPR Publication 16-1, "Radio Interference Measuring Apparatus and Measurement Methods."

### 3. TEST SPECIFICATIONS

#### 3.1. STANDARDS

The following tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with FCC Part 2, Part 27

| Description                                                  | Reference                                    | Results   |
|--------------------------------------------------------------|----------------------------------------------|-----------|
| AGC threshold                                                | KDB 935210 D05 v01r04 3.2                    | Compliant |
| Out-of-band rejection                                        | KDB 935210 D05 v01r04 3.3                    | Compliant |
| Input-versus-output signal comparison                        | § 2.1049                                     | Compliant |
| Input/output power and amplifier/booster gain                | § 2.1046,<br>§ 27.50(j)(2),<br>§ 27.50(j)(4) | Compliant |
| Out-of-band/out-of-block emissions<br>and spurious emissions | § 2.1051,<br>§ 27.53(l)(1)                   | Compliant |
| Spurious emissions radiated                                  | § 2.1053,<br>§ 27.53(l)(1)                   | Compliant |
| Frequency Stability                                          | § 2.1055<br>§ 27.54                          | Compliant |

### 3.2. ADDITIONAL DESCRIPTIONS ABOUT TEST

Except for the following cases, EUT was tested under normal operating conditions.

: Out-of-band rejection test requires maximum gain condition without AGC.

The test was generally based on the method of KDB 935210 D05 v01r04 and only followed ANSI C63.26-2015 if there was no test method in KDB standard.

EUT was tested with following modulated signals provide by applicant.

| Band Name       | Tested signals                                       |
|-----------------|------------------------------------------------------|
| 3.7 GHz Service | 5G NR 20 MHz                                         |
|                 | 5G NR 40 MHz                                         |
|                 | 5G NR 60 MHz                                         |
|                 | 5G NR 80 MHz                                         |
|                 | 5G NR 100 MHz                                        |
|                 | 5G NR 100MHz + 60 MHz + 80 MHz + 40 MHz (4 Carriers) |

The EUT supports both a single carrier and multiple carriers configurations, and the multi-carrier configuration is only 4-carrier of 100 MHz, 60 MHz, 80 MHz, and 40 MHz

This device is capable of SISO operation and 2x2 MIMO operation when configured in the Alliance HROU\_4000 enclosure with the transmitter approved under FCC ID W6UNHCBANDMR. Test data for MIMO operations are addressed in this report (FCC ID: W6UNHCBANDR for ANT 1, FCC ID: W6UNHCBANDMR for ANT 2).

All power supplies of operation were investigated and the worst case configuration results are reported.

- Mode: 110~220 Vac / -42~-56 Vdc

- Worst case: 110~220 Vac

The tests results included actual loss value for attenuator and cable combination as shown in the table below.

\*This equipment has been used to each port, but we only listed one equipment for simplicity.

##### Note:

- Equipment listed above that calibrated during the testing period was set for test after the calibration.
- Equipment listed above that has a calibration due date during the testing period, the testing is completed before equipment expiration date.

## 5. TEST RESULT

### 5.1. AGC THRESHOLD

#### Test Requirement:

**KDB 935210 D05 v01r04**

Testing at and above the AGC threshold is required.

#### Test Procedures:

Measurements were in accordance with the test methods section 3.2 of KDB 935210 D05 v01r04.

In the case of fiber-optic distribution systems, the RF input port of the equipment under test (EUT) refers to the RF input of the supporting equipment RF to optical convertor; see also descriptions and diagrams for typical booster systems in KDB Publication 935210 D02

Devices intended to be directly connected to an RF source (donor port) only need to be evaluated for any over-the-air transmit paths.

- a) Connect a signal generator to the input of the EUT.
- b) Connect a spectrum analyzer or power meter to the output of the EUT using appropriate attenuation as necessary.
- c) The signal generator should initially be configured to produce either of the required test signals.
- d) Set the signal generator frequency to the center frequency of the EUT operating band.
- e) While monitoring the output power of the EUT, measured using the methods of ANSI C63.26-2015 subclause 5.2.4.4.1, increase the input level until a 1 dB increase in the input signal power no longer causes a 1 dB increase in the output signal power.
- f) Record this level as the AGC threshold level.
- g) Repeat the procedure with the remaining test signal.

Output power measurement in subclause 5.2.4.4.1 of ANSI C63.26

- a) Set span to  $2 \times$  to  $3 \times$  the OBW.
- b) Set RBW = 1% to 5% of the OBW.
- c) Set VBW  $\geq 3 \times$  RBW.
- d) Set number of measurement points in sweep  $\geq 2 \times$  span / RBW.
- e) Sweep time: auto-couple
- f) Detector = power averaging (rms).
- g) If the EUT can be configured to transmit continuously, then set the trigger to free run.
- h) Omit
- i) Trace average at least 100 traces in power averaging (rms) mode if sweep is set to auto-couple. To accurately determine the average power over multiple symbols, it can be necessary to increase the number of traces to be averaged above 100 or, if using a manually configured sweep time, increase the sweep time.

- j) Compute the power by integrating the spectrum across the OBW of the signal using the instrument's band or channel power measurement function, with the band/channel limits set equal to the OBW band edges. If the instrument does not have a band or channel power function, then sum the spectrum levels (in linear power units) at intervals equal to the RBW extending across the entire OBW of the spectrum.

**Test Results:**

| Test Band                    | Link     | Signal                                   | Center Frequency<br>(MHz) | AGC Threshold Level<br>(dBm) | Output Level<br>(dBm) |

## 5.2. OUT-OF-BAND REJECTION

### Test Requirement:

KDB 935210 D05 v01r04

Out-of-band rejection required.

### Test Procedures:

Measurements were in accordance with the test methods section 3.3 of KDB 935210 D05 v01r04.

A signal booster shall reject amplification of other signals outside of its passband. Adjust the internal gain control of the EUT (if so equipped) to the maximum gain for which equipment certification is sought.

- a) Connect a signal generator to the input of the EUT.
- b) Configure a swept CW signal with the following parameters:
  - 1) Frequency range =  $\pm 250\%$  of the passband, for each applicable CMRS band.
  - 2) Level = a sufficient level to affirm that the out-of-band rejection is  $> 20$  dB above the noise floor and will not engage the AGC during the entire sweep.
  - 3) Dwell time = approximately 10 ms.
  - 4) Number of points =  $\text{SPAN}/(\text{RBW}/2)$ .
- c) Connect a spectrum analyzer to the output of the EUT using appropriate attenuation.
- d) Set the span of the spectrum analyzer to the same as the frequency range of the signal generator.
- e) Set the resolution bandwidth (RBW) of the spectrum analyzer to be 1 % to 5 % of the EUT passband, and the video bandwidth (VBW) shall be set to  $\geq 3 \times \text{RBW}$ .
- f) Set the detector to Peak Max-Hold and wait for the spectrum analyzer's spectral display to fill.
- g) Place a marker to the peak of the frequency response and record this frequency as  $f_0$ .
- h) Place two markers, one at the lowest and the other at the highest frequency of the envelope of the spectral display, such that each marker is at or slightly below the  $-20$  dB down amplitude, to determine the 20 dB bandwidth.
- i) Capture the frequency response of the EUT.
- j) Repeat for all frequency bands applicable for use by the EUT.

## Test Results:

### 3.7 GHz Service (Ant1) / Downlink

### 3.7 GHz Service (Ant2) / Downlink

### 5.3. INPUT-VERSUS-OUTPUT SIGNAL COMPARISON

#### Test Requirement:

##### § 2.1049 Measurements required: Occupied bandwidth.

The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured under the specified conditions of § 2.1049 (a) through (i) as applicable.

#### Test Procedures:

Measurements were in accordance with the test methods section 3.4 of KDB 935210 D05 v01r04.

A 26 dB bandwidth measurement shall be performed on the input signal and the output signal; alternatively, the 99% OBW can be measured and used. See KDB Publication 971168 [R8] for more information on measuring OBW.

- a) Connect a signal generator to the input of the EUT.
- b) Configure the signal generator to transmit the AWGN signal.
- c) Configure the signal amplitude to be just below the AGC threshold level (see 3.2), but not more than 0.5 dB below.
- d) Connect a spectrum analyzer to the output of the EUT using appropriate attenuation.
- e) Set the spectrum analyzer center frequency to the center frequency of the operational band under test. The span range of the spectrum analyzer shall be between 2 times to 5 times the emission bandwidth (EBW) or alternatively, the OBW.
- f) The nominal RBW shall be in the range of 1 % to 5 % of the anticipated OBW, and the VBW shall be  $\geq 3 \times \text{RBW}$ .
- g) Set the reference level of the instrument as required to preclude the signal from exceeding the maximum spectrum analyzer input mixer level for linear operation. In general, the peak of the spectral envelope must be more than  $[10 \log (\text{OBW} / \text{RBW})]$  below the reference level. Steps f) and g) may require iteration to enable adjustments within the specified tolerances.
- h) The noise floor of the spectrum analyzer at the selected RBW shall be at least 36 dB below the reference level.
- i) Set spectrum analyzer detection function to positive peak.
- j) Set the trace mode to max hold.
- k) Determine the reference value: Allow the trace to stabilize. Set the spectrum analyzer marker to the highest amplitude level of the displayed trace (this is the reference value) and record the associated frequency.
- l) Place two markers, one at the lowest and the other at the highest frequency of the envelope of the spectral display, such that each marker is at or slightly below the  $-26$  dB down amplitude. The 26 dB EBW (alternatively OBW) is the positive frequency difference between the two markers. If the spectral envelope crosses the  $-26$  dB down amplitude at multiple points, the lowest or highest frequency shall be selected as the frequencies that are the furthest removed from the center frequency at which the spectral envelope crosses the  $-26$  dB down amplitude point.
- m) Repeat steps e) to l) with the input signal connected directly to the spectrum analyzer (i.e., input signal

measurement).

- n) Compare the spectral plot of the input signal (determined from step m) to the output signal (determined from step l) to affirm that they are similar (in passband and rolloff characteristic features and relative spectral locations), and include plot(s) and descriptions in test report.
- o) Repeat the procedure [steps e) to n)] with the input signal amplitude set to 3 dB above the AGC threshold.
- p) Repeat steps e) to o) with the signal generator set to the narrowband signal.
- q) Repeat steps e) to p) for all frequency bands authorized for use by the EUT.

## Test Results:

Tabular data of Output Occupied Bandwidth

| Test Band                 | Link     | Signal                                   | Center Frequency<br>(MHz) | 99 % OBW<br>(MHz) | 26 dB OBW<br>(MHz) |
|---------------------------|----------|------------------------------------------|---------------------------|-------------------|--------------------|

#### 5.4. INPUT/OUTPUT POWER AND AMPLIFIER/BOOSTER GAIN

##### Test Requirement:

##### § 2.1046 Measurements required: RF power output.

- (a) For transmitters other than single sideband, independent sideband and controlled carrier radiotelephone, power output shall be measured at the RF output terminals when the transmitter is adjusted in accordance with the tune-up procedure to give the values of current and voltage on the circuit elements specified in § 2.1033(c)(8). The electrical characteristics of the radio frequency load attached to the output terminals when this test is made shall be stated.
- (b) For single sideband, independent sideband, and single channel, controlled carrier radiotelephone transmitters the procedure specified in paragraph (a) of this section shall be employed and, in addition, the transmitter shall be modulated during the test as specified and applicable in § 2.1046 (b) (1-5). In all tests, the input level of the modulating signal shall be such as to develop rated peak envelope power or carrier power, as appropriate, for the transmitter.
- (c) For measurements conducted pursuant to paragraphs (a) and (b) of this section, all calculations and methods used by the applicant for determining carrier power or peak envelope power, as appropriate, on the basis of measured power in the radio frequency load attached to the transmitter output terminals shall be shown. Under the test conditions specified, no components of the emission spectrum shall exceed the limits specified in the applicable rule parts as necessary for meeting occupied bandwidth or emission limitations.

##### § 27.50 Power limits and duty cycle.

- (j) The following power requirements apply to stations transmitting in the 3700-3980 MHz band:
  - (2) The power of each fixed or base station transmitting in the 3700-3980 MHz band and situated in any geographic location other than that described in paragraph (j)(1) of this section is limited to an EIRP of 1640 Watts/MHz. This limit applies to the aggregate power of all antenna elements in any given sector of a base station.
  - (4) Equipment employed must be authorized in accordance with the provisions of § 27.51. Power measurements for transmissions by stations authorized under this section may be made either in accordance with a Commission-approved average power technique or in compliance with paragraph (j)(5) of this section. In measuring transmissions in this band using an average power technique, the peak-to-average ratio (PAR) of the transmission may not exceed 13 dB.

**Test Procedures:**

Measurements were in accordance with the test methods section 3.5 of KDB 935210 D05 v01r04.

Adjust the internal gain control of the EUT to the maximum gain for which the equipment certification is being sought. Any EUT attenuation settings shall be set to their minimum value.

Input power levels (uplink and downlink) should be set to maximum input ratings while confirming that the device is not capable of operating in saturation (non-linear mode) at the rated input levels, including during the performance of the input/output power measurements.

**3.5.2 Measuring the EUT mean input and output power**

- a) Connect a signal generator to the input of the EUT.
- b) Configure to generate the test signal.
- c) The frequency of the signal generator shall be set to the frequency  $f_0$  as determined from out-of-band rejection test.
- d) Connect a spectrum analyzer or power meter to the output of the EUT using appropriate attenuation as necessary.
- e) Set the signal generator output power to a level that produces an EUT output level that is just below the AGC threshold, but not more than 0.5 dB below.
- f) Measure and record the output power of the EUT; use ANSI C63.26-2015 subclause 5.2.4.4.1, for power measurement.
- g) Remove the EUT from the measurement setup. Using the same signal generator settings, repeat the power measurement at the signal generator port, which was used as the input signal to the EUT, and record as the input power. EUT gain may be calculated as described in 3.5.5.
- h) Repeat steps f) and g) with input signal amplitude set to 3 dB above the AGC threshold level.
- i) Repeat steps e) to h) with the narrowband test signal.
- j) Repeat steps e) to i) for all frequency bands authorized for use by the EUT.

**3.5.5 Calculating amplifier, repeater, or industrial booster gain**

After the input and output power levels have been measured as described in the preceding subclauses, the gain of the EUT can be determined from:

$$\text{Gain (dB)} = \text{output power (dBm)} - \text{input power (dBm)}.$$

Report the gain for each authorized operating frequency band, and each test signal stimulus.

**Note:** If  $f_0$  that determined from out-of-band test is smaller or greater than difference of test signal's center frequency and operation band block, test is performed at the lowest or the highest frequency that test signals can be passed.

## Test Results:

## 5.5. OUT-OF-BAND/OUT-OF-BLOCK EMISSIONS AND SPURIOUS EMISSIONS

### Test Requirements:

#### § 2.1051 Measurements required: Spurious emissions at antenna terminals:

The radio frequency voltage or powers generated within the equipment and appearing on a spurious frequency shall be checked at the equipment output terminals when properly loaded with a suitable artificial antenna. Curves or equivalent data shall show the magnitude of each harmonic and other spurious emission that can be detected when the equipment is operated under the conditions specified in § 2.1049 as appropriate. The magnitude of spurious emissions which are attenuated more than 20 dB below the permissible value need not be specified.

#### § 27.53 Emission limits.

(I) 3.7 GHz Service. The following emission limits apply to station transmitting in the 3700-3980 MHz band:

- (1) For base station operations in the 3700-3980 MHz band, the conducted power of any emission outside the licensee's authorized bandwidth shall not exceed -13 dBm/MHz. Compliance with this paragraph (I)(1) is based on the use of measurement instrumentation employing a resolution bandwidth of 1 megahertz or greater. However, in the 1 megahertz bands immediately outside and adjacent to the licensee's frequency block, a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

### Test Procedures:

Measurements were in accordance with the test methods section 3.6 of KDB 935210 D05 v01r04.

Spurious emissions shall be measured using a single test signal sequentially tuned to the low, middle, and high channels or frequencies within each authorized frequency band of operation.

Out-of-band/out-of-block emissions (including intermodulation products) shall be measured under each of the following two stimulus conditions:

- a) two adjacent test signals sequentially tuned to the lower and upper frequency band/block edges;
- b) a single test signal, sequentially tuned to the lowest and highest frequencies or channels within the frequency band/block under examination.

NOTE—Single-channel boosters that cannot accommodate two simultaneous signals within the passband may be excluded from the test stipulated in step a).

#### 3.6.2 Out-of-band/out-of-block emissions conducted measurements

- a) Connect a signal generator to the input of the EUT.  
If the signal generator is not capable of generating two modulated carriers simultaneously, then two discrete signal generators can be connected with an appropriate combining network to support this two-signal test.
- b) Set the signal generator to produce two AWGN signals as previously described.

- c) Set the center frequencies such that the AWGN signals occupy adjacent channels, as defined by industry standards such as 3GPP or 3GPP2, at the upper edge of the frequency band or block under test.
- d) Set the composite power levels such that the input signal is just below the AGC threshold, but not more than 0.5 dB below. The composite power can be measured using the procedures provided in KDB Publication 971168, but it will be necessary to expand the power integration bandwidth so as to include both of the transmit channels.
- e) Connect a spectrum analyzer to the output of the EUT using appropriate attenuation as necessary.
- f) Set the RBW = reference bandwidth in the applicable rule section for the supported frequency band.
- g) Set the VBW =  $3 \times$  RBW.
- h) Set the detector to power averaging (rms) detector.
- i) Set the Sweep time = auto-couple.
- j) Set the spectrum analyzer start frequency to the upper block edge frequency, and the stop frequency to the upper block edge frequency plus 300 kHz or 3 MHz, for frequencies below and above 1 GHz, respectively.
- k) Trace average at least 100 traces in power averaging (rms) mode.
- l) Use the marker function to find the maximum power level.
- m) Capture the spectrum analyzer trace of the power level for inclusion in the test report.
- n) Repeat steps k) to m) with the composite input power level set to 3 dB above the AGC threshold.
- o) Reset the frequencies of the input signals to the lower edge of the frequency block or band under test.
- p) Reset the spectrum analyzer start frequency to the lower block edge frequency minus 300 kHz or 3 MHz, for frequencies below and above 1 GHz, respectively, and the stop frequency to the lower band or block edge frequency.
- q) Repeat steps k) to n).
- r) Repeat steps a) to q) with the signal generator configured for a single test signal tuned as close as possible to the block edges.
- s) Repeat steps a) to r) with the narrowband test signal.
- t) Repeat steps a) to s) for all authorized frequency bands or blocks used by the EUT.

### 3.6.3 Spurious emissions conducted measurements

- a) Connect a signal generator to the input of the EUT.
- b) Set the signal generator to produce the broadband test signal as previously described.
- c) Set the center frequency of the test signal to the lowest available channel within the frequency band or block.
- d) Set the EUT input power to a level that is just below the AGC threshold, but not more than 0.5 dB below.
- e) Connect a spectrum analyzer to the output of the EUT using appropriate attenuation as necessary.
- f) Set the RBW = reference bandwidth in the applicable rule section for the supported frequency band of operation.
- g) Set the VBW  $\geq 3 \times$  RBW.
- h) Set the Sweep time = auto-couple.
- i) Set the spectrum analyzer start frequency to the lowest RF signal generated in the equipment, without going below 9 kHz, and the stop frequency to the lower band/block edge frequency minus 1 MHz.

The number of measurement points in each sweep must be  $\geq (2 \times \text{span}/\text{RBW})$ , which may require that the measurement range defined by the start and stop frequencies be subdivided, depending on the available number of measurement points provided by the spectrum analyzer.

- j) Select the power averaging (rms) detector function.
- k) Trace average at least 10 traces in power averaging (rms) mode.
- l) Use the peak marker function to identify the highest amplitude level over each measured frequency range. Record the frequency and amplitude and capture a plot for inclusion in the test report.
- m) Reset the spectrum analyzer start frequency to the upper band/block edge frequency plus 1 MHz, and the spectrum analyzer stop frequency to 10 times the highest frequency of the fundamental emission. The number of measurement points in each sweep must be  $\geq (2 \times \text{span}/\text{RBW})$ , which may require that the measurement range defined by the start and stop frequencies be subdivided, depending on the available number of measurement points provided by the spectrum analyzer.
- n) Trace average at least 10 traces in power averaging (rms) mode.
- o) Use the peak marker function to identify the highest amplitude level over each of the measured frequency ranges. Record the frequency and amplitude and capture a plot for inclusion in the test report; also provide tabular data, if required.
- p) Repeat steps i) to o) with the input test signals firstly tuned to a middle band/block frequency/channel, and then tuned to a high band/block frequency/channel.
- q) Repeat steps b) to p) with the narrowband test signal.
- r) Repeat steps b) to q) for all authorized frequency bands/blocks used by the EUT.

**Note:**

- (1) In some bands, RBW was reduced to 0.1 %, 1 %, and 10 % of the reference bandwidth for measuring out-of-band and unwanted spurious emissions level, so the limit lines were compensated according to section 5.7.2 of ANSI C63.26-2015.

| Reduced RBW             | 0.1 %  | 1 %    | 10 %   |
|-------------------------|--------|--------|--------|
| Limit line compensation | -30 dB | -20 dB | -10 dB |

- (2) We applied MIMO Limit Values because they are the worst according to KDB 662911 D01 v02r01.
  - 2Tx MIMO correction:  $10 \log(\text{NANT}) = 10 \log(2) = 3.01 \text{ dB} // -13 \text{ dBm} - 10 \log(2) = -16.01 \text{ dBm}$
- (3) 2Tx summation values of out-of-band/out-of-block and spurious emissions have enough margin compared to the limit.

|                 |                                          | High    | -22.471 | -20.787 | -18.538       |       |

## Test Results: Plot data of Out-of-band/out-of-block emissions

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 20 MHz / Lower

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 20 MHz / Upper

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 20 MHz / Lower

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 20 MHz / Upper

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 40 MHz / Lower

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 40 MHz / Upper

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 40 MHz / Lower

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 40 MHz / Upper

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 60 MHz / Lower

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 60 MHz / Upper

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 60 MHz / Lower

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 60 MHz / Upper

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 80 MHz / Lower

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 80 MHz / Upper

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 80 MHz / Lower

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 80 MHz / Upper

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 100 MHz / Lower

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 100 MHz / Upper

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 100 MHz / Lower

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 100 MHz / Upper

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 20 MHz / Lower

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 20 MHz / Upper

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 20 MHz / Lower

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 20 MHz / Upper

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 40 MHz / Lower

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 40 MHz / Upper

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 40 MHz / Lower

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 40 MHz / Upper

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 60 MHz / Lower

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 60 MHz / Upper

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 60 MHz / Lower

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 60 MHz / Upper

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 80 MHz / Lower

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 80 MHz / Upper

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 80 MHz / Lower

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 80 MHz / Upper

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 100 MHz / Lower

Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 100 MHz / Upper

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 100 MHz / Lower

\*Note: The result is -15.885 dBm that has enough margin compared to SISO limit(-13 dBm). For 2Tx MIMO operation, 2Tx summation value is compliant with MIMO limit(-16.01 dBm) as shown in data table on page 80, 81.

+3 dB above Out-of-band (two adjacent test signals) / 3.7 GHz Service (Ant2) / Downlink / 5G NR 100 MHz / Upper

Out-of-band (single test signal) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 20 MHz / Lower

Out-of-band (single test signal) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 20 MHz / Upper

+3 dB above Out-of-band (single test signal) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 20 MHz / Lower

+3 dB above Out-of-band (single test signal) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 20 MHz / Upper

Out-of-band (single test signal) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 40 MHz / Lower

Out-of-band (single test signal) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 40 MHz / Upper

+3 dB above Out-of-band (single test signal) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 40 MHz / Lower

+3 dB above Out-of-band (single test signal) / 3.7 GHz Service (Ant1) / Downlink / 5G NR 40 MHz / Upper
