

Attention Certifying Agency:

This letter is to attest that Energy Aware Technology Inc. has reduced the output power at the band edges in order for its PowerTab MK2 (PTMK2) product to maintain compliance with required power limits.

In order to maintain compliance with the power limit at the upper band edge (2483.5MHz) our firmware supports per-channel power settings. These per-channel power settings are programmed into non-volatile memory during manufacture. At device start-up, the output power for our radio on ch26 is limited to -15dBm, which results in a total output power after the front end module of 2.25dBm. No radio communications are performed before the limit is set, and all communications performed after the limit is set will comply with the limit. Future firmware upgrades cannot change the limits programmed into the device during manufacture.

If you have any questions or concerns please contact:
