

### Prediction of MPE limit at a given distance

Equation from page 18 of OET Bulletin 65, Edition 97-01

$$S = \frac{PG}{4\pi R^2}$$

where: S = power density

P = power input to the antenna

G = power gain of the antenna in the direction of interest relative to an isotropic radiator

R = distance to the center of radiation of the antenna

Maximum peak output power at the antenna terminal: 22.70 (dBm)

Maximum peak output power at the antenna terminal: 186.2087137 (mW)

Antenna gain(typical): 5 (dBi)

Maximum antenna gain: 3.16227766 (numeric)

Prediction distance: 20 (cm)

Prediction frequency: 915 (MHz)

MPE limit for uncontrolled exposure at prediction frequency: 0.61 (mW/cm^2)

**Power density** at prediction frequency: **0.117147** (mW/cm^2)

Therefore device complies with FCC and Industry Canada RF radiation exposure limits for general population as a mobile device (distance > 20cm)
