6 Test Results

6.1 E.U.T. test conditions

Power supply: DC 12V (Vehicle used)

Requirements: 15.31(e) :For intentional radiators, measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, shall be performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage. For battery operated equipment, the equipment tests shall be performed using a new battery.

Type of antenna: Integral

Operating Environment:

Temperature: 22-25.0 °C

Humidity: 48-55% RH

Atmospheric Pressure: 1001-1010 mbar

Test frequencies: According to the 15.31(m) Measurements on intentional radiators or receivers, other than TV broadcast receivers, shall be performed and, if required, reported for each band in which the device can be operated with the device operating at the number of frequencies in each band specified in the following table:

Frequency range over which device operates	Number of frequencies	Location in the range of operation
1 MHz or less	1	Middle
1 to 10 MHz	2	1 near top and 1 near bottom
More than 10 MHz	3	1 near top. 1 near middle and 1 near bottom

The EUT have 199 channels between the 88.1MHz & 107.9MHz with 100KHz channel

Test EUT in transmitting mode with:
 Lowest channel: 88.1MHz;Middle channel: 98.1MHz;Highest channel:107.9MHz.

6.2 Radiated Emissions

Test Requirement:	FCC Part15 C Section 15.239
Test Method:	Based on FCC Part 15 C Section 15.239
Test Date:	Jul 05, 2008
Measurement Distance:	3m (Semi-Anechoic Chamber)
Frequency range:	30 MHz – 10GHz for transmitting mode. Test instrumentation resolution bandwidth 120 kHz (30 MHz - 1000 MHz), 1 MHz (above 1GHz)
Operation:	Receive antenna scan height 1 - 4 m, polarization Vertical/ Horizontal

Requirements:

(b) The field strength of any emissions within the permitted 200 kHz band shall not exceed 250 microvolts/meter at 3 meters. The emission limit in this paragraph is based on measurement instrumentation employing an average detector. The provisions in Section 15.35 for limiting peak emissions apply.

(c) The field strength of any emissions radiated on any frequency outside of the specified 200 kHz band shall not exceed the general radiated emission limits in Section 15.209.

The limit for average field strength dBuV/m for the fundamental frequency = 48.0 dB μ V/m.

And the limit for peak field strength dBuV/m for the fundamental frequency = 68.0 dB μ V/m

Test Procedure:

The procedure used was ANSI Standard C63.4-2003. According to 15.33, the receive was scanned from 30MHz to 1.1GHz. When an emission was found, the table was rotated to produce the maximum signal strength. An initial pre-scan was performed for in peak detection mode using the receiver. The EUT was measured for both the Horizontal and Vertical polarities and performed a pre-test three orthogonal planes. For intentional radiators, measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, shall be performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage. The worst case emissions were reported.

Test Configuration:

- 1) 30MHz to 1GHz emissions:

- 2) Above 1GHz emissions:
