3 Equipment under test (EUT)

3.1 General information

Product type:	RFID reader / writer		
Model Name:	TWN4 Slim LEGIC		
HVIN:	20207		
Manufacturer:	Elatec GmbH		
Serial number:	2021024617		
Version:	Hardware:	B	
	Software:	B1.09/NKB3.22/STD2.03/B/BT1.07EL	
Short description:	EUT is a RFID reader / writer operating at the frequencies 125 kHz and 13.56 MHz. Additionally, a fully certified Bluetooth Low Energy module is also integrated.		
FCC ID:	WP5TWN4F16		
IC certification number:	7948A-TWN4F16		
FCC ID of integrated BLE module:	WP5EINTLEG1		
IC certification number of integrated BLE module:	7948A-EINTLEG1		
RF technology 1:

4 Test results

This clause gives details about the test results as collected on page 5.

The climatic conditions are recorded during the tests. It is ensured that the climatic conditions are within the following ranges:

<i>Ambient temperature</i>	<i>Ambient humidity</i>	<i>Ambient pressure</i>
15°C to 35°C	30 % to 75 %	86 kPa to 106 kPa

4.1 FCC

4.1.1 SAR test exclusion, except WPT

Reference: Part 2, Section 2.1093

Basic standard: n/a

Performed by:	Jennifer Riedel B. Eng.	Date of test:	February 8, 2021
---------------	-------------------------	---------------	------------------

Result:	<input checked="" type="checkbox"/> Limits kept	<input type="checkbox"/> Limits not kept
---------	---	--

4.1.1.1 Requirements and limits for separation distance ≤ 20 cm

This estimation follows the general guidelines for RF Exposure according to KDB 447498.

As noted in §2.103(b) For purposes of this section, a portable device is defined as a transmitting device designed to be used so that the radiating structure(s) of the device is/are within 20 centimeters of the body of the user.

According §2.1093 (d)(i)(2): The SAR limits for general population/uncontrolled exposure are 0.08 W/kg, as averaged over the whole body, and a peak spatial-average SAR of 1.6 W/kg, averaged over any 1 gram of tissue (defined as a tissue volume in the shape of a cube). Exceptions are the parts of the human body treated as extremities, such as hands, wrists, feet, ankles, and pinnae, where the peak spatial-average SAR limit is 4 W/kg, averaged over any 10 grams of tissue (defined as a tissue volume in the shape of a cube). Exposure may be averaged over a time period not to exceed 30 minutes to determine compliance with general population/uncontrolled SAR limits.

4.2 Canada

4.2.1 Frequency range 3 kHz up to 10 MHz

Requirement: RSS-102 Issue 5, section 2.5.1
 Basic standard: SPR-002
 IEEE C95.3

Performed by: Jennifer Riedel B. Eng. Date of test: January 25, 2021

Result (Note 1): Test passed Test not passed

Note(s):

1. For information about measurement uncertainties see page 24.

4.2.1.4 Test setup

Picture 1: Setup of magnetic field test at a measurement distance of 0 cm

Picture 2: Setup of electric field test at a measurement distance of 0 cm

4.2.1.5 Limits

According to note 5 in section 2.5.1 of RSS-102:

Transmitters operating between 3 kHz and 10 MHz, meeting the exemption from routine SAR evaluation, shall demonstrate compliance to the instantaneous limits in section 4 of RSS-102. Therefore, these limits apply irrespective of the separation distance between the user or bystanders and the device.

The exposure limits in section 4 of RSS-102 are adopted from Health Canada’s Safety Code 6.

According to section 2.1 of Safety Code 6:

Limits for internal electric field strength are intended to prevent the occurrence of nerve stimulation (NS). At frequencies between 3 kHz and 10 MHz, basic restrictions for internal electric field strength in excitable tissues as shown in table 1 of Safety Code 6 (i.e. table 2 of RSS-102) shall not be exceeded. For conditions where the determination of internal electric field strength is not possible or practical (e.g. by measurement or modelling), external unperturbed field strength assessment shall be carried out and the reference levels outlined in section 2.2 of Safety Code 6 shall be respected.

For transmitters operating between 3 kHz and 10 MHz, the requirements of table 4 and table 6 in section 4 of RSS-102 apply which are adopted from table 3 and table 4 of Safety Code 6, section 2.2:

<i>Electric Field Strength Reference Levels</i>				
<i>Frequency Range (MHz)</i>	<i>Reference Level Basis</i>	<i>Reference Level (E_{RL}), (V/m, RMS)</i>		<i>Reference Period</i>
		<i>Uncontrolled Environment</i>	<i>Controlled Environment</i>	
0.003 – 10	NS	83	170	Instantaneous (Note 1)

Table 4: Electric field strength reference levels

<i>Magnetic Field Strength Reference Levels</i>				
<i>Frequency Range (MHz)</i>	<i>Reference Level Basis</i>	<i>Reference Level (H_{RL}), (A/m, RMS)</i>		<i>Reference Period (minutes)</i>
		<i>Uncontrolled Environment</i>	<i>Controlled Environment</i>	
0.003 – 10	NS	90	180	Instantaneous (Note 1)

Table 5: Magnetic field strength reference levels

Notes:

- At no point in time shall the RMS values for electric- and magnetic-fields exceed the reference levels with an instantaneous reference period in table 4 and table 5. In the case of RF fields with amplitude modulation, the RMS value during the maximum of the modulation envelope shall be compared to the reference level.

According to section 6.5 of SPR-002:

The basic restrictions are based on internal induced electric field or SAR. The relationship between the induced field and that of the exposure area is proportional; thus, in cases where the limbs are the primary point of exposure, the induced field would be less than that induced in the trunk of the human body.

When assessing compliance at the compliance distance, where limb exposure is the primary exposed condition, the following table may be used for relaxation of the RSS-102 nerve stimulation reference levels.

<i>Exposure condition</i>	<i>Relaxation factor</i>
Whole Body / Torso / Head	1.0
Leg	1.5
Arm	2.5
Hand / foot	5.0

Table 6: Limb exposure limit relaxation

A second exposure evaluation must be taken at the distance at which the trunk of the body would rest in relation to the device under test.

4.2.1.6 Test procedure

The RF exposure test is performed by the direct measurement method using a Broadband probe as described in clause 6.6.1.1 of the supplementary procedure SPR-002.

To find the worst case emissions, the field probe is moved over all sides of the EUT at the separation distances as noted in clause 4.2.1.7 while observing the display of the field meter. At the worst case position, the final value is measured and recorded.

According to section 3.2 of RSS-102, RF exposure evaluation of devices shall be made in accordance with the latest version of IEEE C95.3. Definition 3.95 in clause 3 of IEEE C95.3 specifies the separation distance applied to the measurement of electric and magnetic fields as the “distance between a source and the nearest point on the probe sensing elements”.

4.2.1.7 Test results

RF technology 1:

Application:	RFID
Operation frequency range:	125 kHz
Antenna model	Loop antenna
Antenna connector:	none
Antenna type:	internal
	not detachable
Environment:	Uncontrolled
Primary exposure condition:	Whole body

Note(s):

1. Premeasurements were performed to determine the worst case which is documented below.
2. The worst case emission occurred without tag.

<i>Frequency (kHz)</i>	<i>Measured value (V/m)</i>	<i>Relaxation factor</i>	<i>Limit (V/m)</i>	<i>Fraction of limit (%)</i>	<i>Result</i>

4.2.2 SAR test exclusion, except 3 kHz – 10 MHz

Requirement: RSS-102 Issue 5, section 2.5.1

Basic standard: n/a

Performed by: Jennifer Riedel B. Eng. Date of test: February 8, 2021

Result: Limits kept Limits not kept

4.2.2.1 Exemption Limits for Routine Evaluation – SAR Evaluation

According to RSS 102 clause 2.5.1:

SAR evaluation is required if the separation distance between the user and/or bystander and the antenna and/or radiating element of the device is less than or equal to 20 cm, except when the device operates at or below the applicable output power level (adjusted for tune-up tolerance) for the specified separation distance defined in Table 1.

Frequency (MHz)	Exemption Limits (mW)				
	At separation distance of ≤5 mm	At separation distance of 10 mm	At separation distance of 15 mm	At separation distance of 20 mm	At separation distance of 25 mm
≤300	71 mW	101 mW	132 mW	162 mW	193 mW
450	52 mW	70 mW	88 mW	106 mW	123 mW
835	17 mW	30 mW	42 mW	55 mW	67 mW
1900	7 mW	10 mW	18 mW	34 mW	60 mW
2450	4 mW	7 mW	15 mW	30 mW	52 mW
3500	2 mW	6 mW	16 mW	32 mW	55 mW
5800	1 mW	6 mW	15 mW	27 mW	41 mW

Frequency (MHz)	Exemption Limits (mW)				
	At separation distance of 30 mm	At separation distance of 35 mm	At separation distance of 40 mm	At separation distance of 45 mm	At separation distance of ≥50 mm
≤300	223 mW	254 mW	284 mW	315 mW	345 mW
450	141 mW	159 mW	177 mW	195 mW	213 mW
835	80 mW	92 mW	105 mW	117 mW	130 mW
1900	99 mW	153 mW	225 mW	316 mW	431 mW
2450	83 mW	123 mW	173 mW	235 mW	309 mW
3500	86 mW	124 mW	170 mW	225 mW	290 mW
5800	56 mW	71 mW	85 mW	97 mW	106 mW

⁴ The exemption limits in Table 1 are based on measurements and simulations of half-wave dipole antennas at separation distances of 5 mm to 25 mm from a flat phantom, providing a SAR value of approximately 0.4 W/kg for 1 g of tissue. For low frequencies (300 MHz to 835 MHz), the exemption limits are derived from a linear fit. For high frequencies (1900 MHz and above), the exemption limits are derived from a third order polynomial fit.

⁵ Transmitters operating between 0.003-10 MHz, meeting the exemption from routine SAR evaluation, shall demonstrate compliance to the instantaneous limits in Section 4.

Output power level shall be the higher of the maximum conducted or equivalent isotropically radiated power (e.i.r.p.) source-based, time-averaged output power. For controlled use devices where the 8 W/kg for 1 gram of tissue applies, the exemption limits for routine evaluation in Table 1 are multiplied by a factor of 5. For limb-worn devices where the 10 gram value applies, the exemption limits for routine evaluation in Table 1 are multiplied by a factor of 2.5. If the operating frequency of the device is between two frequencies located in Table 1, linear interpolation shall be applied for the applicable separation distance. For test separation distance less than 5 mm, the exemption limits for a separation distance of 5 mm can be applied to determine if a routine evaluation is required.

For medical implants devices, the exemption limit for routine evaluation is set at 1 mW. The output power of a medical implants device is defined as the higher of the conducted or e.i.r.p to determine whether the device is exempt from the SAR evaluation.

4.2.2.2 Results

The following data are based on applicants document: Test report 200632-AU02+W06 Test report of the test laboratory Element Materials Technology Straubing GmbH

RF technology 2:

Application:	RFID
Operation frequency range:	13.56 MHz
Antenna model	Loop antenna
Antenna connector:	none
Antenna type:	internal not detachable
Maximum E-Field:	45.53 dBµV / m at 30 m

Information related to Exposure:

Tune-up tolerance (according to the manufacturer):	± 4 dB
Separation distance:	< 5 mm
Exposure tier:	general public
Power averaging over time:	Not applied

Separation distance (mm)	Channel frequency (MHz)	ERP + tolerance (dBm)	ERP + tolerance (mW)	Limit 1-g SAR (mW)	Ratio of limit	Result
< 5	13.56	-24.23	0.004	71.0	0.00006	Passed

Table 9: Result of SAR test exclusion, exposure to the head and body

EIRP is calculated using the formula of ANSI C63.10-2013 clause 9.5:

$$EIRP = E + 20\log(d) - 104.7$$

Where: EIRP = equivalent isotropically radiated power in dBm
 E = electric field strength in dBµV/m
 d = measurement distance in meters (m)

The following data are based on applicants document: Test report 200632-AU02+W08 Test report of the test laboratory Element Materials Technology Straubing GmbH

RF technology 3:

Application: Bluetooth low energy
Operation frequency range: 2402 MHz to 2480 MHz
Antenna model: Chip antenna
Antenna gain: 0.5 dBi
Antenna connector: none
Antenna type: internal
not detachable
Maximum conducted output power: -0.74 dBm at 2402 MHz

Information related to Exposure:

Tune-up tolerance (according to the manufacturer): ± 4 dB
Separation distance: < 5 mm
Exposure tier: general public
Power averaging over time: Not applied

<i>Separation distance (mm)</i>	<i>Channel frequency (MHz)</i>	<i>EIRP + tolerance (dBm)</i>	<i>EIRP + tolerance (mW)</i>	<i>Limit 1-g SAR (mW)</i>	<i>Ratio of limit</i>	<i>Result</i>
< 5	2402	3.76	3.0	4.0	0.75	Passed

4.2.3 Simultaneous transmissions SAR test exclusion, except 3 kHz – 10 MHz

Requirement: RSS-102 Issue 5, section 2.5.1

Reference: Notice 2016-DRS001

Performed by:	Jennifer Riedel B. Eng.	Date of test:	February 8, 2021
Result:	<input checked="" type="checkbox"/> Limits kept	<input type="checkbox"/> Limits not kept	

4.2.3.1 Requirements and limit

According to Notice 2016-DRS001:

The SAR exemption limits outlined in clause 2.5.1 of RSS-102 have been derived based on an approximate SAR value of 0.4 W/kg using half-wave dipole antennas. As such, when simultaneous transmitter SAR evaluations include transmitters that have been exempt from routine SAR evaluation, the SAR must be estimating based on the ratio between the maximum tune-up tolerance limit of the transmitter that has been exempt and the exemption limit at the specific distance and frequency for that transmitter. This ratio must be multiplied by 0.4 W/kg (2.0 W/kg for controlled use and 1.0 W/kg for limb worn devices) in order to calculate the estimated SAR level.

<i>Exposure tier</i>	<i>Region of body</i>	<i>SAR exemption limit (W/kg)</i>
General public	Head and trunk	0.4
General public	Limbs	1.0
Occupational	Head and trunk	2.0
Occupational	Limbs	5.0

Table 11: SAR exemption limits

4.2.3.2 Results

Note(s):

1. There is only one technology below 10 MHz (nerve stimulation), therefore no simultaneous transmission consideration.
2. There are two technologies operating above 10 MHz (technology 2 and 3) which can transmit simultaneously.
3. The ratios are taken from clause 4.2.2.2.

Exposure tier:

Head and trunk

<i>Technology</i>	<i>Ratio</i>	<i>Factor (W/kg)</i>	<i>Estimated SAR (W/kg)</i>	<i>Sum of estimated SAR (W/kg)</i>	<i>SAR exemption limit (W/kg)</i>	<i>Result</i>
2	0.00006	0.4	0.000024	0.300024	0.4	Passed
3	0.75	0.4	0.3

6 Measurement uncertainty

Test	Frequency range	Equipment used	Expanded uncertainty	U_{Limit}	$k=$
Magnetic field	1 Hz – 10 kHz	ELT 400 + probe	± 28.147 %	+58.% / -37 %	2
Magnetic field	10 kHz – 400 kHz	ELT 400 + probe	± 28.147 %	+41.% / -30 %	2
H-field	300 kHz – 800 kHz	NBM 550 + HF3061	± 25.602 %	+41.% / -30 %	2
H-field	800 kHz – 1 MHz	NBM 550 + HF3061	± 25.245 %	+41.% / -30 %	2
H-field	1 MHz – 30 MHz	NBM 550 + HF3061	± 25.245 %	+41.% / -30 %	2
E-field	100 kHz – 1 MHz	NBM 550 + EF0691	± 28.467 %	+41.% / -30 %	2
E-field	1 MHz – 30 MHz	NBM 550 + EF0691	± 27.324 %	+41.% / -30 %	2
E-field	30 MHz – 1 GHz	NBM 550 + EF0691	± 27.324 %	+100.% / -50 %	2
E-field	1 GHz – 4 GHz	NBM 550 + EF0691	± 30.244 %	+100.% / -50 %	2
E-field	4 GHz – 6 GHz	NBM 550 + EF0691	± 32.150 %	+100.% / -50 %	2
Contact current	0 Hz – 110 MHz	EZ 17	+41.25 % / -29.21.%	+100.% / -50 %	2

Note(s):

1. The uncertainty stated is the expanded uncertainty obtained by multiplying the standard uncertainty by the coverage factor k . For a confidence level of 95 % the coverage factor k is 2.
2. The values of the measurement uncertainty as listed above are equal to or lower than the required ones stated in table 3 of EN 62369-1 2009 and listed as (U_{Limit}) in the table above.
3. Simple acceptance is applied as the decision rule while keeping the specified limits (U_{ETSI}) for the expanded measurement uncertainty (i.e. Test Uncertainty Ratio $TUR \geq 1:1$). That means, compliance is based on the recorded level by the lab irrespective of the expanded measurement uncertainty value but with a limitation to it.
4. All used test instrument as well as the test accessories are calibrated at regular intervals.
