

ULTRA RF LABEL COVER GRAPHIC PLACEMENT

The printed “cover graphic” label displayed on the Ultra Wireless Label product is constructed such that both front and back sides are cut together from adhesive-backed stock. Label material can be paper or plastic material, and is die cut to proper size. The front (A side) graphic contains product description, instructions, PakSense logo / logotype, pushbutton and LED identifiers, and barcode. The back side (B side) graphic includes a printed serial number barcode, PakSense logo / logotype, patent numbers, FCC ID and model number. An example label is depicted below:

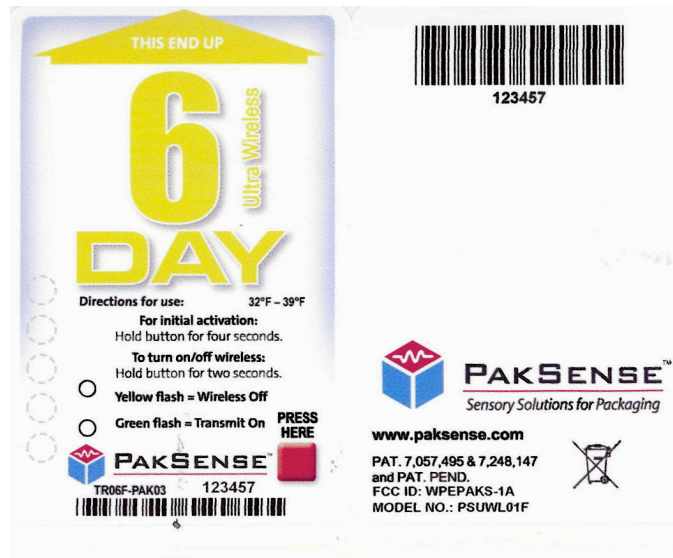

FIGURE 1. ULTRA WIRELESS LABEL COVER GRAPHIC

The installation of the cover graphic over the printed circuit assembly is accomplished by removing the adhesive liner and folding the cover graphic in half along its vertical center line over the printed circuit assembly such that the A side is covering the top side of the printed circuit assembly. The orientation of the cover graphic before installation is depicted below. Once the cover graphic is assembled onto the printed circuit assembly, the entire “smart label” assembly is sealed into a clear plastic pouch for protection from its operating environment.
