# **DOCUMENT REVISION HISTORY**

<b>Revision Number</b>	Report Number	Description of Revision	Date of Revision
2	R1110131-90	Updated Report	2012-01-04

# **1. General Information**

## **1.1 Product Description for Equipment under Test (EUT)**

The report has been prepared on behalf of Teltronic S.A.U. and their product FCC ID: WT7PTRNKTMBS410, IC: 8624A-PTMBS410, model: MBS Unit 409-430 MHz. The EUT is a 409-430 MHz Transceiver that operates under FCC Part 90 and IC RSS-119.

Specifications		
Frequency Band	409-430 MHz	
Emission designator	20K0D7W, 20K0D7E, 20K0D7D	
Modulation	$\pi/4$ -DQPSK	
RF Output Power	12.36 Watts	
RF Channel Spacing	25 kHz (Spectrum Efficiency 6.25 kHz) Note 1	
Necessary/Authorized Bandwidth	20 kHz	
Power Supply	110/220 VAC (90-264 VAC), 50/60 Hz.	

*Note 1:* TETRA access scheme is TDMA with 4 physical channels per carrier. The channel bandwidth is 25 kHz. As a result, the equipment meets a spectrum efficiency standard of one voice channel per 6.25 kHz of channel bandwidth. Modulation is  $\pi/4$ -DQPSK with 18 Ksym/sec. This modulation is based on transmitting two bits per symbol, so the data rate on each sub-carrier is 9000 bits/sec (higher than 4800 bits per second per 6.25 kHz of channel bandwidth).

# **1.2** Mechanical Description

The EUT measures approximately 68cm (L) x 27.8cm (W) x 37cm (H) and weighs 28 kg.

The test data gathered are from production sample. Serial number: R1110131-1 provided by the BACL.

# 1.3 Objective

This Type approval report is prepared on behalf of *Teltronic S.A.U.* in accordance with Part 90 of the Federal Communication Commissions rules, Industry Canada RSS-119 Issue 11, June 2011.

# **1.4** Related Submittal(s)/Grant(s)

N/A

# 1.5 Test Methodology

All tests and measurements indicated in this document were performed in accordance with the Code of federal Regulations Title 47 Part 2, Sub-part J as well as the following individual parts:

Part 90 – Private Land Mobile Radio Service

And IC RSS-119, Issue 11, June 2011- Land Mobile and Fixed Radio Transmitters and Receivers Operating in the Frequency Range 27.41-960 MHz.

Applicable Standards: TIA603-C and ANSI 63.4-2003, American National Standard for Method of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the range of 9 kHz to 40 GHz.

All emissions measurement was performed by Bay Area Compliance Laboratories Corp. The radiated testing was performed at an antenna-to-EUT distance of 3 meters.

# **1.6 Measurement Uncertainty**

All measurements involve certain levels of uncertainties, especially in the field of EMC. The factors contributing to uncertainties are spectrum analyzer, cable loss, antenna factor calibration, antenna directivity, antenna factor variation with height, antenna phase center variation, antenna factor frequency interpolation, measurement distance variation, site imperfections, mismatch (average), and system repeatability.

Based on NIS 81, The Treatment of Uncertainty in EMC Measurements, the values ranging from  $\pm 2.0$  dB for Conducted Emissions tests and  $\pm 4.0$  dB for Radiated Emissions tests are the most accurate estimates pertaining to uncertainty of EMC measurements at BACL Corp.

Detailed instrumentation measurement uncertainties can be found in BACL Corp. report QAP-018.

# **1.7** Test Facility

The test site used by BACL Corp. to collect radiated and conducted emissions measurement data is located at its facility in Sunnyvale, California, USA.

The test sites at BACL have been fully described in reports submitted to the Federal Communication Commission (FCC) and Voluntary Control Council for Interference (VCCI). The details of these reports has been found to be in compliance with the requirements of Section 2.948 of the FCC Rules on February 11 and December 10, 1997 and Article 8 of the VCCI regulations on December 25, 1997. The facility also complies with the radiated and AC line conducted test site criteria set forth in ANSI C63.4-2003.

The Federal Communications Commission, Industry Canada, and Voluntary Control Council for Interference has the reports on file and is listed under FCC registration number: 90464, IC registration number: 3062A, and VCCI Registration Number: C-2463 and R-2698. The test site has been approved by the FCC, IC, and VCCI for public use and is listed in the FCC Public Access Link (PAL) database.

Additionally, BACL is a National Institute of Standards and Technology (NIST) accredited laboratory, under the National Voluntary Laboratory Accredited Program (Lab Code 200167-0). The current scope of accreditations can be found at <u>http://ts.nist.gov/ts/htdocs/210/214/scopes/2001670.htm</u>.

# 2 System Test Configuration

# 2.1 Justification

The EUT was configured for testing according to TIA/EIA-603-C.

The EUT was tested in the normal (native) operating mode to represent *worst*-case results during the final qualification test.

# 2.2 Equipment Modifications

No modifications were made to the EUT.

#### Teltronic S.A.U.

# 4 FCC §2.1091 & IC RSS-102 - RF Exposure Information

# 4.1 Applicable Standards

#### FCC §2.1091

(a) Requirements of this section are a consequence of Commission responsibilities under the National Environmental Policy Act to evaluate the environmental significance of its actions. See subpart I of part 1 of this chapter, in particular §1.1307(b).

According to §1.1310 and §2.1091 RF exposure is calculated.

Frequency Range (MHz)	Electric Field Strength (V/m)	Magnetic Field Strength (A/m)	Power Density (mW/cm <sup>2</sup> )	Averaging Time (minutes)
	(A) Limits for	Occupational/Controll	ed Exposures	
0.3-3.0	614	1.63	*(100)	6
3.0-30	1842/f	4.89/f	*(900/f <sup>2</sup> )	6
30-300	61.4	0.163	1.0	6
300-1500	/	/	f/300	6
1500-100,000	/	/	5	6
(B) Limits for General Population/Uncontrolled Exposure				
0.3-1.34	614	1.63	*(100)	30
1.34-30	842/f	2.19/f	*(180/f <sup>2</sup> )	30
30-300	27.5	0.073	0.2	30
300-1500	/	/	f/1500	30
1500-100,000	/	/	1	30

Limits	for	Exposures
Linno	101	LAPOSUICS

f = frequency in MHz

\* = Plane-wave equivalent power density

Note 1 to Table 1: Occupational/controlled limits apply in situations in which persons are exposed as a consequence of their employment provided those persons are fully aware of the potential for exposure and can exercise control over their exposure. Limits for occupational/controlled exposure also apply in situations when an individual is transient through a location where occupational/controlled limits apply provided he or she is made aware of the potential for exposure.

Note 2 to Table 1: General population/uncontrolled exposures apply in situations in which the general public may be exposed, or in which persons that are exposed as a consequence of their employment may not be fully aware of the potential for exposure or can not exercise control over their exposure.

According to IC RSS-102 Issue 2 section 4.4, RF Field Strength Limits for Controlled Use Devices (Controlled Environment).

Frequency Range (MHz)	Electric Field (V/m rms)	Magnetic Field (A/m rms)	Power Density (W/m <sup>2</sup> )	Time Averaging (min)
0.003 - 1	600	2.19	-	6
1 - 10	600 / f	4.9 / f	-	6
10 - 30	60	4.9 / f	-	6
30 - 300	60	0.163	10*	6
300 - 1 500	$3.54 f^{0.5}$	$0.0094 f^{0.5}$	f/30	6
1 500 - 15 000	137	0.364	50	6
15 000 - 150 000	137	0.364	50	616000 / f <sup>1.2</sup>
150 000- 300 000	$0.354 f^{0.5}$	$9.4 \text{ x} 10^{-4} \text{ f}^{0.5}$	3.33 x 10 <sup>-4</sup> f	616000 / f <sup>1.2</sup>

**Note:** *f* is frequency in MHz

\* = Power density limit is applicable at frequencies greater than 100 MHz

#### **MPE Prediction**

Predication of MPE limit at a given distance, Equation from OET Bulletin 65, Edition 97-01

$$S = PG/4\pi R^2$$

Where: S = power density

P = power input to antenna

G = power gain of the antenna in the direction of interest relative to an isotropic radiator

R = distance to the center of radiation of the antenna

Maximum peak output power at antenna input terminal (dBm):	40.92
Maximum peak output power at antenna input terminal (mW):	<u>12359.47</u>
Prediction distance (cm):	<u>20</u>
Prediction frequency (MHz):	<u>420</u>
Maximum Antenna Gain, typical (dBi):	<u>17</u>
Maximum Antenna Gain (numeric):	<u>50.12</u>
Power density of prediction frequency at 20 cm $(W/m^2)$ :	12.3237
Power density of prediction frequency at 20 cm (mW/cm <sup><math>2</math></sup> ):	1.23237
MPE limit for uncontrolled exposure at prediction frequency $(W/m^2)$ :	<u>14</u>
MPE limit for uncontrolled exposure at prediction frequency (mW/cm <sup>2</sup> ):	1.4

#### **Conclusion**

The device complies with MPE requirements by providing a safe separation distance of 20 cm between the antenna, which have a maximum gain of 17 dBi, including any radiating structure, and any person when normally operated.

#### Proposed RF exposure safety information to include in User's Manual:

#### **"FCC RF Exposure Requirements":**

#### CAUTION:

The antenna(s) used for this transmitter must not be co-located or operating in conjunction with any other antenna or transmitter:

- Antennas used for this transmitter must not exceed an antenna gain of 17 dBi

- For rear deck trunk and roof top installations, the antenna must be located at least 20 cm away from rear-seat

passengers and bystanders in order to comply with the FCC RF exposure requirements.

The following label will be mounted in conspicuous view on the radio.

Restricted to occupational use to safety FCC RF energy exposure limits. See user manual for awareness and control info.

Report Number: R1110131-90

# 5 FCC §2.1046, §90.205 & IC RSS-119 §5.4 – Conducted Output Power

# 5.1 Applicable Standard

According to FCC §2.1046, and §90.205, 806–824 MHz, 851–869 MHz, 896–901 MHz and 935–940 MHz. Power and height limitations are specified in §90.635

According to IC RSS-119 §5.4, the output power should be within  $\pm$  1.0 dB of the manufacture's rated power.

## 5.2 Test Procedure

The RF output of the transmitter was connected to the input of the spectrum analyzer through sufficient attenuation.

Spectrum Analyzer Setting:

RBWVideo BW100 kHz300 kHz

#### **5.3** Test Environmental Conditions

Temperature:	18~24 °C
<b>Relative Humidity:</b>	40~55 %
ATM Pressure:	101.3~102.3 kPa

The testing was performed by Ning Ma on 2010-11-05 ~ 2010-11-09.

#### 5.4 Test Equipment List and Details

Manufacturer	Description	Model	Serial Number	Calibration Date

Test Mode: Transmitting

Channel	Frequency	Conducted Output Power	Conducted Output Power
	(MHz)	(dBm)	(Watt)
Middle	420	40.92	12.359

Report Number: R1110131-90

# 6 FCC §2.1047, §90.207 & IC RSS-119 §5.2 – Modulation Characteristic

#### 6.1 Applicable Standard

#### FCC §2.1047 & §90.207:

- (a) Equipment which utilizes voice modulated communication shall show the frequency response of the audio modulating circuit over a range of 100 to 5000 Hz. for equipment which is required to have a low pass filter, the frequency response of the filter, or all of the circuitry installed between the modulation limited and the modulated stage shall be supplied.
- (b) Equipment which employs modulation limiting, a curve showing the percentage of modulation versus the modulation input voltage shall be supplied.

#### IC RSS-119 §5.2

Equipment that operates in frequency bands other than 746-770 MHz and 794-800 MHz may employ any type of modulation. The type of modulation used shall be reported.

#### 6.2 Test Procedure

Test Method: TIA/EIA-603-C 2.2.3

#### 6.3 Test Result

Please refer to the hereinafter plots.

#### **Transmitter Low Pass Filter**

Type of Emission: 20K0D7E, 20K0D7D, 20K0D7W, 22K0D7E, 22K0D7D, 22K0D7W, The modulation used is  $\pi$ /4-shifted Differential Quaternary Phase Shift Keying ( $\pi$ /4-DQPSK), with a modulation rate of 18k symbol/sec. (36k bit/sec).

A root-raised-cosine filter (RRC) is used as transmitting and receiving filter in this digital communication system to perform matched filtering.

The combined response of two such filters is that of the raised-cosine filter.

The raised-cosine filter is a filter frequently used for pulse-shaping in digital modulation known for its ability to minimize intersymbol interference (ISI).

The access scheme is TDMA with 4 physical channels per carrier.

The following graph is the transfer function of the aforementioned filter.

Above 2500		

Standard Channel Spacing/Bandwidth

#### As per FCC §2.1049, §90.210

Emission Mask B. For transmitters that are equipped with an audio low-pass filter, the power of any emission must be attenuated below the unmodulated carrier power (P) as follows:

1) On any frequency removed from the assigned frequency by more than 50 percent, but not more than 100 percent of the authorized bandwidth: At least 25 dB.

2) On any frequency removed from the assigned frequency by more than 100 percent, but not more than 250 percent of the authorized bandwidth: At least 35 dB.

3) On any frequency removed from the assigned frequency by more than 250 percent of the authorized bandwidth: At least  $43 + 10\log(P) dB$ 

The resolution bandwidth was 100Hz or greater for measuring up to 250 kHz from the edge of the authorized frequency segment, and 30 kHz or greater for measuring more than 250 kHz from the authorized frequency segment.

#### As per IC RSS-119 §5.8

5.8.2 Emission Mask C for Transmitters not Equipped with and Audio Low-pass Filter

The power of any emission shall be attenuated below the transmitter output power P (dBW) as specified in the table below:

Displacement Frequency, f <sub>d</sub> (kHz)	Minimum Attenuation (dB)	Resolution Bandwidth (Hz)
$5 \leq f_d \leq 10$	83 log <sub>10</sub> (f <sub>d</sub> /5)	300
	whichever is the lesser attenuation:	
$10 \le f_d \le 50$	50 or	
	$29 \log_{10}(f_d^2/11)$	300
$f_d > 50$	$43 + 10 \log_{10}(p)$	Specified in Section 4.2.1

5.8.10 Emission Mask Y for Equipment with a 25 kHz Channel Spacing and an Occupied Bandwidth greater than 20 kHz

Equipment with a 25 kHz channel spacing and an occupied bandwidth greater than 20 kHz shall have the power of any emission attenuated below the transmitter output power P (dBW) as specified in the table below:

Displacement		
Frequency, f <sub>d</sub> (kHz)	Minimum Attenuation (dB)	<b>Resolution Bandwidth (Hz)</b>
	whichever is the lesser attenuation:	
$12.375 \le f_d \le 13.975$	$30 + 16.67(f_d - 12.375)$ or	
	$55 + 10 \log_{10}(p)$	Specified in Section 4.2.2
	whichever is the lesser attenuation:	
$f_d > 13.975$	57 or	
	$55 + 10 \log_{10}(p)$	Specified in Section 4.2.2

# 7.2 Test Procedure

The RF output of the transmitter was connected to the input of the spectrum analyzer through sufficient attenuation.

The resolution bandwidth of the spectrum analyzer was set at 100 Hz and the spectrum was recorded in the frequency band  $\pm 50$  KHz from the carrier frequency.

#### **7.3** Test Environmental Conditions

Temperature:	18~24 °C
<b>Relative Humidity:</b>	40~55 %
ATM Pressure:	101.3~102.3 kPa

The testing was performed by Ning Ma on 2010-11-05 ~ 2010-11-09.

Note 1: Mobile units may use synchronizing signals from associated base stations to achieve the specified carrier stability.

Note 2: This provision is for digital equipment with a channel spacing of 25 kHz and an occupied bandwidth greater than 20 kHz.

# 9.2 Test Procedure

Frequency Stability vs. Temperature: The equipment under test was connected to an external DC power supply and the RF output was connected to the Spectrum Analyzer via feed-through attenuators. The EUT was placed inside the temperature chamber. The DC leads and RF output cable exited the chamber through an opening made for the purpose.

After the temperature stabilized for approximately 20 minutes, the frequency output was recorded from the Spectrum Analyzer.

Frequency Stability vs. Voltage: An external variable DC power supply Source. The voltage was set to 110% of the nominal value and was then decreased until the transmitter light no longer illuminated; i.e., the end point. The output frequency was recorded for each voltage.

# 9.3 Test Environmental Conditions

Temperature:	18~24 °C
<b>Relative Humidity:</b>	40~55 %
ATM Pressure:	101.3~102.3 kPa

The testing was performed by Ning Ma on 2011-11-05 ~ 2011-11-09.

High Power, Middle Channel 420 MHz, 409~430 MHz Band:

# 10 FCC §2.1053, §90.210 & IC RSS-119 §5.8 – Field Strength of Spurious Radiation

# **10.1 Applicable Standard**

FCC §2.1053 (a) Measurements shall be made to detect spurious emissions that may be radiated directly from the cabinet, control circuits, power leads, or intermediate circuit elements under normal conditions of installation and operation. Curves or equivalent data shall be supplied showing the magnitude of each harmonic and other spurious emission. For this test, single sideband, independent sideband, and controlled carrier transmitters shall be modulated under the conditions specified in paragraph (c) of §2.1049, as appropriate. and §90.210(b),(d): Except as indicated elsewhere in this part, transmitters used in the radio services governed by this part must comply with the emission masks outlined in this section. Unless otherwise stated, per paragraphs (d)(4), (e)(4), and (m) of this section, measurements of emission power can be expressed in either peak or average values provided that emission powers are expressed with the same parameters used to specify the unmodulated transmitter carrier power. For transmitters that do not produce a full power unmodulated carrier, reference to the unmodulated transmitter carrier power refers to the total power contained in the channel bandwidth. Unless indicated elsewhere in this part, the table in this section specifies the emission masks for equipment operating in the frequency bands governed under this part.

IC RSS-119 §5.8

## **10.2 Test Procedure**

The transmitter was placed on a Styrofoam with wooden turntable, and it was normal transmitting with 500hm termination which was also placed on the turntable.

The measurement antenna was placed at a distance of 3 meters from the EUT. During the tests, the antenna height and polarization as well as EUT azimuth were varied in order to identify the maximum level of emissions from the EUT. The test was performed by placing the EUT on 3-orthogonal axis.

The frequency range up to tenth harmonic of the fundamental frequency was investigated.

Remove the EUT and replace it with substitution antenna. A signal generator was connected to the substitution antenna by a non-radiating cable. The absolute levels of the spurious emissions were measured by the substitution.

Spurious emissions in dB = 10 lg (TXpwr in Watts/0.001) - the absolute level

#### **10.3 Test Environmental Conditions**

Temperature:	18~24 °C
<b>Relative Humidity:</b>	40~55 %
ATM Pressure:	101.3~102.3 kPa

The testing was performed by Ning Ma on 2011-11-05 ~ 2011-11-09.

# 11 FCC §90.214 & IC RSS-119 §5.9 - Transient Frequency Behavior

# 11.1 Applicable Standard

FCC §90.214: Transmitters designed to operate in the 150–174 MHz and 421–512 MHz frequency bands must maintain transient frequencies within the maximum frequency difference limits during the time intervals indicated:

12	Maximum	All equipment	
Time intervals <sup>1,2</sup>	frequency difference <sup>3</sup>	421 to 512 MHz	
Transient Frequency Beh	avior for Equipment Designed to	Operate on 25 kHz Channels	
$t_1^4$	± 25.0 kHz	10.0 ms	
t <sub>2</sub>	± 12.5 kHz	25.0 ms	
t <sub>3</sub> <sup>4</sup>	± 25.0 kHz	10.0 ms	
Transient Frequency Beha	vior for Equipment Designed to	Operate on 12.5 kHz Channels	
t_1^4	± 12.5 kHz	10.0 ms	
t_2	± 6.25 kHz	25.0 ms	
t <sub>3</sub> <sup>4</sup>	± 12.5 kHz	10.0 ms	

When a transmitter is turned on, the radio frequency may take some time to stabilize. During this initial period, the frequency error or frequency difference (i.e. between the instantaneous and the steady state frequencies) must not exceed the limits specified in Table 16.

Channel Spacing	Time	Maximum Frequency Difference	Transient Duration Limit (ms)			
(kHz)	filter vals	(kHz)	138-174 MHz	406.1-512 MHz		
	t <sub>1</sub>	±25	5	10		
25	t2	±12.5	20	25		
	t <sub>3</sub>	±25	5	10		
	tı	±12.5	5	10		
12.5	t <sub>2</sub>	±6.25	20	25		
	t3	±12.5	5	10		
	t <sub>1</sub>	±6.25	5	10		
6.25	t <sub>2</sub>	±3.125	20	25		
	t <sub>3</sub>	±6.25	5	10		

#### Table 16 - Transient Frequency Behaviour

<sup>1</sup> t<sub>on</sub>: the instant when a 1 kHz test signal is completely suppressed, including any capture time due to phasing.

t1: the time period immediately following tou.

t<sub>2</sub>: the time period immediately following t<sub>1</sub>.

t3: the time period from the instant when the transmitter is turned off until toff.

toff: the instant when the 1 kHz test signal starts to rise.

<sup>2</sup> If the transmitter carrier output power rating is 6 W or less, the frequency difference during the time periods t<sub>1</sub> and t<sub>3</sub> may exceed the maximum frequency difference for these time periods. The corresponding plot of frequency versus time during t<sub>1</sub> and t<sub>3</sub> shall be recorded in the test report.

# 12 IC RSS-119 §5.11 & IC RSS-310 §3.1 - Receiver Spurious Radiated Emissions

## 12.1 Applicable Standard

IC RSS-119 §5.11, IC RSS-310 §3.1 and RSS-Gen §6

The following receiver spurious emission limits shall be complied with: (a) If a radiated measurement is made, all spurious emissions shall comply with the limits of Table 1.

> Frequency (MHz)
>  Field Strength Microvolts/m at 3 meters
>
>
>  30-88
>  Receivers

## **12.4 Test Environmental Conditions**

Temperature:	18~24 °C		
<b>Relative Humidity:</b>	40~55 %		
ATM Pressure:	101.3~102.3 kPa		

The testing was performed by Ning Ma on 2011-11-05 ~ 2011-11-07.

#### 12.5 Test Procedure

Maximizing procedure was performed on the six (6) highest emissions to ensure EUT compliance is with all installation combinations.

# 12.6 Corrected Amplitude & Margin Calculation

The Corrected Amplitude is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain from the Amplitude reading. The basic equation is as follows:

Corrected Amplitude = Indicated Reading + Antenna Factor + Cable Factor - Amplifier Gain

The "**Margin**" column of the following data tables indicates the degree of compliance with the applicable limit. For example, a margin of -7 dB means the emissions are 7 dB below the maximum limit. The equation for margin calculation is as follows:

Margin = Corrected Amplitude - Limit

# **12.7 Summary of Test Results**

According to the test data, the EUT complied RSS Gen, with the worst margins from the limit listed below:

RX Spurious Emission:

Measure at 3 Meters (30 MHz – 1 GHz)

Model: Receiving				
MarginFrequency(dB)(MHz)		Polarization (Horizontal/Vertical)	Test Range	
-9.13	373.9933	Horizontal	30 MHz - 1 GHz	

Measure at 3 Meters (Above 1 GHz)

Mode: Receiving						
MarginFrequency(dB)(MHz)		Polarization (Horizontal/Vertical)	Test Range			
-27.92	5127.539	Horizontal	1 GHz – 6 GHz
