## 2.3 Traceability

All measurement equipment calibrations are traceable to NIST or where calibration is performed outside the United States, to equivalent nationally recognized standards organizations.

## 2.4 Calibration

Equipment requiring calibration is calibrated periodically by the manufacturer or according to manufacturer's specifications. Additionally all equipment is verified for proper performance on a regular basics using in house standards or comparisons.

## 2.5 Measurement Uncertainty

The estimated combined standard uncertainty for radiated emissions and conducted emissions measurements as below table,

| Items              |                            | Extended Uncertainty |
|--------------------|----------------------------|----------------------|
| CE                 | Disturbance Voltage (dBuV) | U=1.94dB, k=2, σ=95% |
| RE (9kHz-30MHz)    | Field strength (dBuV/m)    | U=3.08dB, k=2, σ=95% |
| RE (30-1000MHz)    | Field strength (dBuV/m)    | U=4.42dB, k=2, σ=95% |
| RE (above 1000MHz) | Field strength (dBuV/m)    | U=4.06dB, k=2, σ=95% |

## 2.6 Location of Original Data

The original copies of all test data taken during actual testing were attached at Appendix1 of this report and delivered to the applicant. A copy has been retained in the TÜV Rheinland (Shenzhen) file for certification follow-up purposes.

**Table 5: Frequency hopping information**

| Technical Specification  | Description  |
|--------------------------|--|
| Hopping Range            | Hereby we declare that the maximum frequency of this device is: 2402-2480MHz. This is according the Bluetooth Core Specification for devices which will be operated in the USA. This was checked during the Bluetooth Qualification tests (Test Case: TRM/CA/04-E).  |
| Hopping Sequence         | Example of a 79 hopping sequence in data mode:<br>33,04,21,44,23,42,53,46,55,48,40,59,72,29,76,31,08,73,<br>07,75,09,45,60,39,58,13,47,11,77,52,35,50,65,54,67,56,<br>69,62,71,64, 7,25,27,66,57,70,74,61,78,63,10,41,05,43,<br>15,44,64,68,02,70,06,01,51,03,55,05,03,66,53,49,36,47,   |
| Receiver input bandwidth | <p>The input bandwidth of the receiver is 1MHz. In every connection one Bluetooth device is the master and the other one is the slave. The master determines the hopping sequence. The slave follows this sequence. Both devices shift between RX and TX time slot according to the clock of the master.</p> <p>Additionally the type of connection is set up at the beginning of the connection. The master adapts its hopping frequency and its TX/RX timing according to the packet type of the connection. Also the slave of the connection will use these settings.</p> <p>Repeating of a packer has no influence on the hopping sequence. The hopping sequence generated by the master of the connection will be followed in any case.</p> <p>That means a repeated packet will not be send on the same frequency, it is send on the next frequency of the hopping sequence.</p> |

## 4. Test Set-up and Operation Modes

### 4.1 Principle of Configuration Selection

**Radio Spectrum:** The equipment under test (EUT) was configured at its highest power output in order to measure its highest possible radiation and conducted level. The test modes were adapted accordingly in reference to the instructions for use.

**Emission:** The equipment under test (EUT) was configured to measure its highest possible radiation level. The test modes were adapted accordingly in reference to the instructions for use.

### 4.2 Test Operation and Test Software

Test operation refers to test setup in chapter 5.

During testing, test software BlueSuite provided by the applicant was used to control the operating channel as well as output power for Bluetooth operation.
