Project Number: 2733706

Report Number: 2733706EMC04 **Revision Level:** 2

Client: Sonim Technologies Inc.

Equipment Under Test: Cellular/PCS CDMA/EvDO Phone with Bluetooth

Marketing Name: Sonim XP Strike

Model: Sonim XP3410-A-R1 (C21F010AA)

Hardware Version: A

Applicable Standards: FCC Part 15 Subpart C, § 15.247

ANSI C63.10: 2009

Report issued on: 26 SEP 2012

Test Result: Compliant

Tested by:

Remarks:

This report details the results of the testing carried out on one sample, the results contained in this test report do not relate to other samples of the same product. The manufacturer should ensure that all products in series production are in conformity with the product sample detailed in this report.

This report may only be reproduced and distributed in full. If the product in this report is used in any configuration other than that detailed in the report, the manufacturer must ensure the new system complies with all relevant standards. Any mention of SGS International Electrical Approvals or Testing done by SGS International Electrical Approvals in connection with distribution or use of the product described in this report must be approved by SGS International Electrical Approvals in writing.

Serial Number: Radiated: A1000012926881, Conducted: A1000012926680
Build Version: B2.5
Firmware Version: XP3410_0200B00_0150T
FCC ID: WYPC21F010AA
Frequency Range: 2402 to 2480 MHz
Number of channels: 79
Modulation type: GFSK, π/4-DQPSK, 8DPSK
Channel spacing: 1 MHz
Antenna: Integral

Rated Voltage: 3.8 VDC Internal Battery

Sample Received Date: 20 July 2012
Dates of testing: 15 August to 17 August 2012

Operating Modes and Conditions

The EUT was configured in software to allow the Bluetooth tester to control the EUT to run continuously exercising all modes of operation.

During testing, the EUT was powered with a fully charged battery.

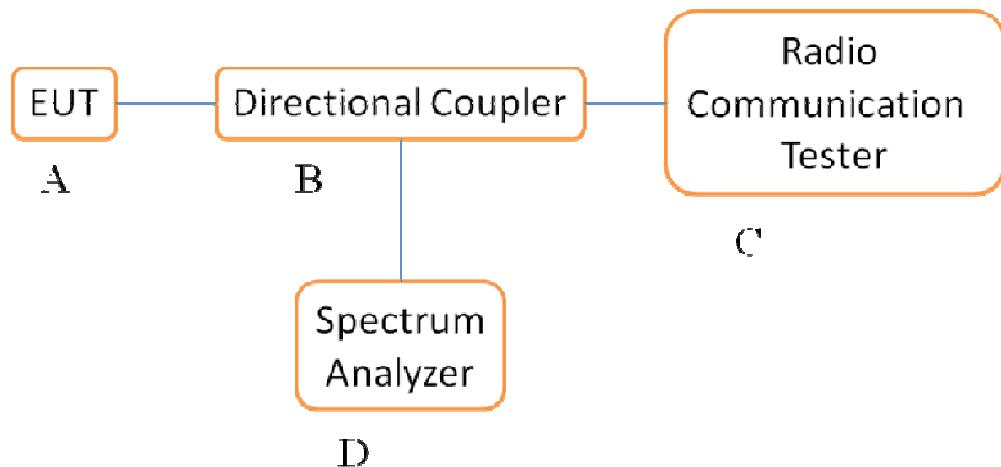

During testing, the hopping sequence was stopped in accordance with Section 5.1 of ANSI C63.10-2009 so that the low, mid and high channels could be tested independently.

Modulations used: For fundamental and spurious measurements, the EUT was configured to operate continuously with Bluetooth modulation enabled.

As specified in Section 5.10.5 of ANSI C63.10:2009:

- Software was designed to allow the EUT to operate
 - at 100 % duty cycle
 - at the worst-case duty cycle to allow measurements in instances where an average correction factor needs to be determined to calculate the average field strength from the measured peak field strength
- The software allowed configuration and operation on all available unlicensed wireless device channels.
- The software allowed configuration and operation using all available modulations and data rates
- The software allowed configuration and operation on all available power out levels
- Since this is a frequency hopping system, the software allowed the hopping sequence to be turned off

5.1 Test Result

Test Description	Test Specification	Test Result
Conducted Spurious Emissions	15.247(d)	Compliant

5.2 Test Method

The test data was measured using a spectrum analyzer with

- Peak detector, max hold
- Resolution bandwidth of at least 100 kHz
- Video bandwidth at least 3x RBW
- Frequency range: 30 MHz to 25 GHz

The limit is 20 dB below the measured peak power.

GFSK and 8DPSK were determined to be the worst case modes of operation for this test.

6.1 Test Result

Test Description	Test Specification	Test Result
Field strength of spurious radiation	15.247(d) and 15.209 RSS 210 2.6, A2.9 (1)(2)	Compliant

6.2 Test Method

The initial preliminary exploratory scans were performed over the frequency range as indicated in the tables below using the max hold function and incorporating a Peak detector and using TILE! software. The final test data was measured using a Quasi-Peak detector below 1GHz and a Peak detector above 1GHz. For harmonics of the fundamental, Average measurements were made by correcting the peak value with the duty cycle correction factor. For emissions other than harmonics of the fundamental, the Average measurements were made using the Average detector. The receivers resolution bandwidth was set to 120 kHz for measurements taken in the 30MHz to 1GHz frequency range and 1MHz for measurements for 1GHZ and higher. Measurements were made with the antenna positioned in both the horizontal and vertical planes of polarization. The antenna height was varied from 1 m to 4 m and the EUT was rotated 360° to find the maximum emitting point for each frequency. The radiated measurements were recorded and compared to the limits indicated in the table below.

For the 15.247(d) requirement, emissions outside of the restricted bands must be 20 dB below the highest emission of the fundamental measured in a 100 kHz band.

Test distance:

- 30 MHz to 1 GHz - The EUT to measurement antenna distance is 3 meters
- 1 to 18 GHz - The EUT to measurement antenna distance is 3 meters
- 18 to 40 GHz - The EUT to measurement antenna distance is 1 meter

7 Dwell Time

7.1 Test Result

Test Description	Basic Standards	Test Result
Dwell Time	15.247(a) (1) (iii)	Pass

7.2 Test Method

The EUT was connected to the spectrum analyzer and Bluetooth tester by a directional coupler with known insertion loss characteristics.

The time slot length is measured of the three different packet types which are available in the Bluetooth Technology. Those are DH1, DH3, and DH5 packets.

The dwell time is calculated by:

$$\text{Dwell time} = \text{time slot length} * \text{hop rate} * 31.6 / \text{number of hopping channels}$$

With:

- Hop rate = $1600 * 1/\text{s}$ for DH1 packets = 1600
- Hop rate = $1600 / 3 * 1/\text{s}$ for DH3 packets = 533.33
- Hop rate = $1600 / 5 * 1/\text{s}$ for DH5 packets = 320
- Number of hopping channels = 79
- $31.6 \text{ s} = 0.4 \text{ seconds multiplied by the number of hopping channels} = 0.4\text{s} * 79$

The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.

8.1 Test Result

Test Description	Basic Standards	Test Result
Channel separation	15.247(a) (1)	Pass

8.2 Test Method

The EUT was connected to the spectrum analyzer and Bluetooth tester by a directional coupler with known insertion loss characteristics.

The test data was measured using a spectrum analyzer with

- Peak detector, max hold
- Span: 3 MHz
- Center Frequency: 2441 MHz
- Resolution bandwidth of at least 30 kHz
- Video bandwidth: 3 MHz RBW
- Sweep time: coupled

10.1 Test Result

Test Description	Basic Standards	Test Result
Conducted Emissions	15.107, Class B ANSI C63.4:2009	Compliant

10.2 Test Method

With the receivers resolution bandwidth was set to 9 kHz the initial preliminary exploratory scans were performed over the measuring frequency range (0.15MHz to 30MHz) using a max hold mode incorporating a Peak detector and Average detector and using the TILE! software. The final test data was measured using a Quasi-Peak detector and Average detector and compared against the limits indicated in the table below.

Frequency Range	Class A Limits (dBuV)		Class B Limits (dBuV)	
	FCC	CISPR	FCC	CISPR
0.15 to 0.5 MHz	Avg 66 QP 79		Avg 56 to 46 QP 66 to 56
