## 2 Operational states

### General:

Full tests were carried out at 156.025 MHz and 162.025 MHz (AIS) and 156.525 MHz (DSC).  
The EUT was powered by an external DC power supply.

### Wanted signal:

#### AIS-Mode:

The Test-Signals were generated either by a modulation source (supplied by the applicant, standard test signal 4) or by the AIS-Simulator "Attingimus" (standard test signal 3).

For the receiver-tests the output signal either of the modulation source or of the simulator was used to modulate a calibrated RF generator from PHOENIX TESTLAB. The received data telegrams were compared transmitted data telegrams.

A number of 200 packets (unless otherwise stated) were used to calculate the Packet Error Rate PER.

#### DSC-Mode:

The DSC test signal 1 was generated by the signal generator AFG320 from SONY-Tektronix.

A number of 100 packets (unless otherwise stated) were used to calculate the Bit Error Rate BER.

### Test-signal overview:

Test-signal:	Bit pattern:
Standard test signal 1	01010101 (defined in subclause 8.4.1 [1])
Standard test signal 2	00001111 (defined in subclause 8.4.2 [1])
Standard test signal 3	Pseudo Random Bit Sequence (defined in subclause 8.4.3 [1])
Standard test signal 4	Pseudo Random Bit Sequence (defined in subclause 8.4.4 [1])
DSC test signal 1	010101 (dotting pattern, refer to ITU-R M.825-3) (defined in subclause A.3.1 [1])

### Unwanted signal:

All unwanted-signals were generated by the RF generators from PHOENIX TESTLAB.

## 3 Additional information

The yellow wire visible on the test sample photographs is the trigger output, which will be used for several transmitter test cases. It will be not installed for mass production.
