### 4.3. Nominal and Maximum Output Power

RF Air interface	Mode	Max. RF Output Power (dBm)
Bluetooth		<b>4.5</b>

### 4.4. Separation distance

Bluetooth	Body	0 mm	Rear	N/A

## 5. Standalone SAR Test Exclusion Considerations

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances  $\leq 50$  mm are determined by:

$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] \cdot \sqrt{f(\text{GHz})} \leq 3.0$ , for 1-g SAR and  $\leq 7.5$  for 10-g extremity SAR, where

- $f_{(\text{GHz})}$  is the RF channel transmit frequency in GHz
- Power and distance are rounded to the nearest mW and mm before calculation
- The result is rounded to one decimal place for comparison

The test exclusions are applicable only when the minimum test separation distance is  $\leq 50$  mm and for transmission frequencies between 100 MHz and 6 GHz. **When the minimum test separation distance is  $< 5$  mm, a distance of 5 mm is applied to determine SAR test exclusion.**

### Body Exposure Condition

RF Air Interface	Max. tune-up tolerance limit		Min. test separation distance (mm)	Frequency (GHz)	SAR test exclusion Result*
	(dBm)	(mW)			
Bluetooth	4.5	3	0	2.480	0.9

### Conclusion:

\*: The computed values are  $\leq 3$ ; therefore, Bluetooth qualifies for Standalone SAR test exclusion.
