RADIO TEST REPORT

REPORT NUMBER: M2010040-3

TEST STANDARD: FCC PART 15 SUBPART C **SECTION 15.247**

ISED RSS-247 SECTION 5.0

- **CLIENT: AUTOMATIC TECHNOLOGY AUSTRALIA PTY LTD**
- **DEVICE: OVERHEAD GARAGE DOOR OPENER**

MODEL: ATS-3AM

- FCC ID: X4K-ATS3DCB11WS
 - IC: 8880A-ATS3DCB11WS

DATE OF ISSUE: 24 MAY 2021

EMC Technologies Pty Ltd reports apply only to the specific samples tested under stated test conditions. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical components. EMC Technologies Pty Ltd shall have no liability for any deductions, inferences or generalisations drawn by the client or others from EMC Technologies Pty Ltd issued reports. This report shall not be used to claim, constitute or imply product endorsement by EMC Technologies Pty Ltd.

Accredited for compliance with ISO/IEC 17025 - Testing. The results of tests, calibration and/or measurements included in this document are traceable to Australian/national standards. NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, medical testing, calibration and inspection reports.

Equipment Under Test (EUT): Overhead Garage Door Opener

1 TEST SUMMARY

Section	Description	FCC	RSS	Result(s)
6.1	Antenna Requirement	§15.203	§RSS-Gen 6.8	Complied
6.2	Restricted Bands of Operation	§15.205	§RSS-Gen 8.10	Complied
6.3	Radiated emission limits; general requirements	§15.209	§RSS-Gen 8.9	Complied
6.4	Conducted Limits	§15.207	§RSS-Gen 8.8	Complied
6.5	20dB bandwidth	§15.247(a)	§RSS-247 5.1(c)	Complied
6.6	Channel Separation	§15.247(a)(1)	§RSS-247 5.1(b)	Complied
6.7	Number of channels and time of occupancy	§15.247(a)(1)	§RSS-247 5.1(c)	Complied
6.8	Peak Output Power	§15.247(b)	§RSS-247 5.4(a)	Complied
6.9	Out-of-Band/Spurious Emissions	§15.247(d)	§RSS-247 5.5	Complied
6.10	Band-Edge Emission Measurements	§15.247(d)	§RSS-247 5.5	Complied
6.11	Maximum Permissible Exposure	§15.247(i)	§RSS-Gen3.4/ §RSS-102	Complied
6.12	Occupied Bandwidth – 99% power	§15.215	§RSS-Gen 6.7	Complied

2 TEST FACILITY

2.1 General

EMC Technologies Pty Ltd is accredited by the FCC as a test laboratory able to perform compliance testing for the public. EMC Technologies Pty Ltd has also been designated as a Conformity Assessment Body (CAB) by Australian Communications and Media Authority (ACMA) under the APECTEL MRA and is designated to perform compliance testing on equipment subject to Certification under Parts 15 and 18 of the FCC Commission's rules – **Registration Number 494713 & Designation number AU0001**.

EMC Technologies Pty Ltd is also an ISED Canada recognized testing laboratory – **ISED** company number: 3569B and CAB identifier number: AU0001.

2.2 NATA Accreditation

NATA is the Australian National laboratory accreditation body and has accredited EMC Technologies to operate to the IEC/ISO17025 requirements. A major requirement for accreditation is the assessment of the company and its personnel as being technically competent in testing to the standards. This requires fully documented test procedures, continued calibration of all equipment to the National Standard at the National Measurements Institute (NMI) and an internal quality system similar to ISO 9002. NATA has mutual recognition agreements with the National Voluntary Laboratory Accreditation Program (NVLAP) and the American Association for Laboratory Accreditation (A²LA).

All testing in this report has been conducted in accordance with EMC Technologies' scope of NATA accreditation to ISO 17025 for both testing and calibration and ISO 17020 for Inspection – **Accreditation Number 5292**.

The current full scope of accreditation can be found on the NATA website: www.nata.com.au

3 TEST EQUIPMENT CALIBRATION

Measurement instrumentation and transducers were calibrated in accordance with the applicable standards by an independent NATA registered laboratory such as Keysight Technologies (Australia) Pty Ltd or the National Measurement Institute (NMI) or in-house. All equipment calibration is traceable to Australian national standards at the National Measurements Institute.

Equipment Type	Make/Model/Serial Number	Last Cal. dd/mm/yyyy	Due Date dd/mm/yyyy	Cal. Interval
Chamber	Frankonia SAC-3-2 (R-144)	10/08/2020	10/08/2023	3 Year ^{*1}

Cables* ³	Huber & Suhner Sucoflex 104A Sn: 503055 (C-457)	04/06/2020	04/06/2021	1 Year ^{*1}
Caples	Huber & Suhner Sucoflex 104A Sn: 800448 (C-520)	04/06/2020	04/06/2021	1 Year ^{*1}

Note *1. Internal NATA calibration.

Note *2. External NATA / A2LA calibration.

Note *3. Cables are verified before measurements are taken.

4 MEASUREMENT UNCERTAINTY

EMC Technologies has evaluated the equipment and the methods used to perform the emissions testing. The estimated measurement uncertainties for emissions tests shown within this report are as follows:

Conducted Emissions:	9 kHz to 30 MHz	±3.2 dB
Radiated Emissions:	9 kHz to 30 MHz	±4.1 dB
	30 MHz to 300 MHz	±5.1 dB
	300 MHz to 1000 MHz	±4.7 dB
	1 GHz to 18 GHz	±4.6 dB
Peak Output Power:		±1.5 dB

The above expanded uncertainties are based on standard uncertainties multiplied by a coverage factor of k=2, providing a level of confidence of approximately 95%.

Application of measurement uncertainty for this report:

The referenced uncertainty standard specifies that determination of compliance shall be based on measurements <u>without</u> taking into account measurement instrumentation uncertainty. However, the measurement uncertainty shall appear in the test report.

5 DEVICE DETAILS

(Information supplied by the Client)

The ATS-3 is an electro-mechanical device for opening and closing Overhead Garage Doors automatically. They can be controlled from inside the garage by a wall mounted wireless transmitter WTX-7V1AM or from a remote location using a wireless handheld transmitter PTX-6V1AM or TB-6V1AM or smart phone via a network.

5.1 EUT (Transmitter) Details

Radio:	Transceiver
Number of Channels:	25
Frequency Band:	902 – 928 MHz
	Low Channel: 912.5 MHz
Operating Frequency:	Mid Channel: 919.7 MHz
	High Channel: 926.9 MHz
Nominal Bandwidth:	340 kHz (declared by client)
Modulation:	2GFSK
Antenna:	1/4 Wave Monopole
Antenna Peak Gain:	0 dBi

5.2 EUT (Host) Details

Test Sample:	Overhead Garage Door Opener
Model:	ATS-3AM
Supply Rating:	110 - 120V, 0.8A, 50/60Hz
Manufacturer:	Countermast Technology (Dalian) Company Limited

5.3 Test Configuration

Testing was performed with the transceiver set to transmit continuously at Low channel (912.5 MHz), Mid Channel (919.7 MHz) and High Channel (926.9 MHz).

5.4 Modifications

No Modification was applied to achieve compliance.

5.5 Deviation from the Standard

Note any deviations to the standard

6 **RESULTS**

6.1 §15.203 / §RSS-Gen 6.8 Antenna Requirement

The transceiver incorporates a Wave Monopole antenna that cannot be replaced by another type.

Antenna Type: ¼ Wave Monopole Antenna gain: 0 dBi Connector: Not Applicable

6.2 §15.205 / §RSS-Gen 8.10 Restricted Bands of Operation

The provisions of the §15.205 restricted bands of operation and §15.209 radiated emissions limits have been met, refer to section 6.9

6.3 §15.209 / §RSS-Gen 8.9 Radiated emission limits; general requirements

The provisions of the §15.205 restricted bands of operation and §15.209 radiated emissions limits have been met, refer to section 6.9.

6.4 §15.207 / §RSS-Gen 8.8 Conducted Limits

6.4.1 Test Procedure

The arrangement specified in ANSI C63.10: 2013 was adhered to for the conducted EMI measurements. The EUT was placed in the RF screened enclosure and a CISPR EMI Receiver as defined in ANSI C63.2: 2009 was used to perform the measurements.

The specified 0.15 MHz to 30 MHz frequency range was sub-divided into sub-ranges to ensure that all short duration peaks were captured. For each of the sub-ranges, the EMI receiver was set to continuous scan with the Peak detector set to Max-Hold mode. The Quasi-Peak detector and the Average detector were then invoked to measure the actual Quasi-Peak and Average level of the most significant peaks, which were detected.

6.4.2 Limits

The limit applied was in accordance to the conducted limits defined in §15.207 / RSS-Gen 8.8.

6.4.3 Results

6.5 §15.247(a) / §RSS-247 5.1(c) 20-dB bandwidth

6.5.1 Test Procedure

The tests were performed in accordance with ANSI C63.10: 2013 Clause 6.9.2.

The 20 dB bandwidth was measured while the device was transmitting with typical modulation applied. The resolution bandwidth of 10 kHz and the video bandwidth of 30 kHz were utilised when measuring the bandwidth.

6.5.2 Limits

The Maximum allowed 20-dB bandwidth of the hopping channel is 500 kHz.

Measuring...

6.6 §15.247(a) / §RSS-247 5.1(b) Channel Separation

6.6.1 Test procedure

The tests were performed in accordance with ANSI C63.10: 2013 Clause 7.8.2.

The channel separation was measured while the device was transmitting with typical hopping function enable.

6.6.2 Limits

In the band 902 - 928 MHz, the channel separation must be more than 25 kHz or the 20-dB bandwidth whichever is greater.

6.6.3 Results

6.7 §15.247(a) / §RSS-247 5.1(c) Number of channels and time of occupancy

6.7.1 Test procedure

The tests were performed in accordance with ANSI C63.10: 2013 Clause 7.8.3 for Number of hopping frequencies and Clause 7.8.4 for Time of occupancy.

6.7.2 Limits

In the band 902 - 928 MHz, frequency hopping systems operation bands shall use at least 25 hopping frequencies. The average time of occupancy on any channel shall not be greater than 0.4 seconds within a 10 seconds period.

6.7.3 Results

6.8 §15.247(b) / §RSS 5.4(a) Peak Output Power

6.8.1 Test procedure

The field strength of the fundamental transmitted frequency was measured inside a semi-anechoic chamber compliant with ANSI C63.4: 2014 in accordance to ANSI C63.10: 2013 clause 7.8.5.

The EUT was positioned on a test turn-table and rotated through 360° to determine the highest emissions. The measurement antenna was also varied between 1 and 4 metres height. Different orientations of the EUT (x, y and z-axis) and measurement antenna polarisations (vertical and horizontal) were investigated to produce the highest emission EIRP. All measurements were made at a distance of 3 metres. The fundamental emissions were measured using a peak detector.

6.8.2 Limits

The maximum conducted output power at 902 - 928 MHz is 250mW.

6.8.3 Results

The measured radiated field strength is converted to equivalent conducted output power for checking compliance (KDB 558074 D01 Section 3).

Frequency (MHz)	E-Field @ 3 m (dBuV/m)	EIRP (mW)	Antenna Gain (dBi)	Equivalent Conducted Output Power (mW)	Limit (mW)	Results

Graph 6-12: Max EIRP, 926.9 MHz

6.9 15.247(d) / §RSS 5.5 Out-of-Band/Spurious Emissions

6.9.1 Test procedure

Radiated out-of-band/spurious emissions measurements were performed in a semi-anechoic chamber compliant with ANSI C63.4: 2014.

The test frequency range was sub-divided into smaller bands with the defined resolution bandwidths to permit reliable display and identification of emissions.

Frequency range [MHz]	Measurement Bandwidth [kHz]	Measurement Distance [m]	Antenna
0.009 to 0.150	0.2	3	0.6 metre leen enterne
0.150 to 30	9	3	0.6 metre loop antenna
30 to 1000	120	3	Biconilog hybrid
1000 to 18 000	1000	3	Standard gain or broadband
18 000 to 40 000	1000	1	horn

EUT was set at a height of 0.8 m for measurements below 1000 MHz and set at a height of 1.5 m for measurements above 1000 MHz.

The sample was slowly rotated with the spectrum analyser set to Max-Hold. This was performed for at least two antenna heights. When an emission was located, it was positively identified and its maximum level found by rotating the automated turntable and by varying the antenna height. For below 1000 MHz the emissions were measured with a Quasi-Peak detector, and for above 1000 MHz the emissions were measured with Peak and Average detectors.

The measurement data for each frequency range was corrected for cable losses, antenna factors and preamplifier gain. This process was performed for both horizontal and vertical polarisations of the measurement antenna.

EUT was investigated on all three axes (x, y, and z). Measurements on the worst axis are presented below.

6.9.2 Limits

The limit applied is in accordance with the out-of-band/spurious emissions limit defined in §15.247(d) / §RSS 5.5.

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power.

The in-band peak PSD in 100 kHz bandwidth were measured. The maximum PSD level was used to establish the limit for nonrestricted frequency bands. However, the general limits of §15.209 apply for the restricted bands of operation defined in §15.205.

Freq. (MHz)	Peak at 3 m (dBµV/m)	Established Limit at 3m (dBµV/m)
912.5	113.68	-
919.7	113.76	-

6.11 §15.247(i) / §RSS-Gen 3.4/§RSS-102 Maximum Permissible Exposure

The EUT complied with the applicable radio frequency exposure levels. Refer to EMC Technologies report M2010040-5 & M2010040-6.

6.12 §15.215 / §RSS-Gen 6.7 Occupied Bandwidth – 99% power

6.12.1 Test procedure

The bandwidth containing 99% power of the transmitted signal was measured using the procedure from ANSI C63.10 section 6.9.

6.12.2 Limits

The 99% power bandwidth should be contained within the frequency band 902 - 928 MHz.

6.12.3 Results

Table 6-15: Occupied bandwidth										
Frequency [MHz]	99% Bandwidth [kHz]	High Frequency [MHz]	Result							
912.5	313.17	912.35	912.66	Complied
