***SCOPE***

Test data has been taken pursuant to the relevant DFS requirements of the standard FCC Part 15 Subpart E, Unlicensed National Information Infrastructure (U-NII) Devices.

Tests were performed in accordance with these standards together with the current published versions of the basic standards referenced therein as outlined in Elliott Laboratories test procedures. The test results recorded herein are based on a single type test of the Avaya model WLAN AP 8120 and therefore apply only to the tested sample. The sample was selected and prepared by Vipin Naik of Avaya.

***OBJECTIVE***

The objective of the manufacturer is to comply with the standards identified in the previous section. In order to demonstrate compliance, the manufacturer or a contracted laboratory makes measurements and takes the necessary steps to ensure that the equipment complies with the appropriate technical standards. Compliance with some DFS features is covered through a manufacturer statement or through observation of the device.

***STATEMENT OF COMPLIANCE***

The tested sample of the Avaya model WLAN AP 8120 complied with the DFS requirements of FCC Part 15.407(h)(2).

Maintenance of compliance is the responsibility of the manufacturer. Any modifications to the product should be assessed to determine their potential impact on the compliance status of the device with respect to the standards detailed in this test report.

***DEVIATIONS FROM THE STANDARD***

No deviations were made from the test methods and requirements covered by the scope of this report.

**EQUIPMENT UNDER TEST (EUT) DETAILS****GENERAL**

The Avaya model WLAN AP 8120 is an 802.11abgn wireless router/access point that is designed to provide wireless connectivity for enterprise network systems.

The sample was received on April 4, 2011 and tested on June 30, 2011. The EUT consisted of the following component(s):

| Manufacturer | Model        | Description  | Serial Number |
|--------------|--------------|--------------|---------------|
| Avaya        | WLAN AP 8120 | Access Point | Prototype     |

The manufacturer declared values for the EUT operational characteristics that affect DFS are as follows:

**Operating Modes (5470 – 5725 MHz)**

- Master Device 5470-5725 MHz

**Antenna Gains / EIRP (5470 – 5725 MHz)**

|                            | 5470 – 5725 MHz |
|----------------------------|-----------------|
| Lowest Antenna Gain (dBi)  | 3.05            |
| Highest Antenna Gain (dBi) | 3.05            |
| EIRP Output Power (dBm)    | > 200 mW        |

- Power can exceed 200mW eirp

**Channel Protocol**

- IP Based  
 Frame Based  
 OTHER \_\_\_\_\_

**OTHER EUT DETAILS**

The following EUT details should be noted: The EUT contains 2 abgn radio modules. One module is used for 2.4GHz operation and one module is used for 5GHz operation. Simultaneous transmission is possible, but never in the same band at the same time. The device supports 2x3 MIMO operation.

The WLAN AP8120 is a modified version of the WLAN AP 8120, approved under the same FCC ID. The internal antenna was removed and 6 reverse SMA connectors were mounted on the enclosure to allow for connection of external antennas.

**ANTENNA SYSTEM**

There are two external antennas to be included in this permissive change.

- 1) Laird, S24517PT, 3x3 Dual-Band Panel Antenna, 8dBi @ 2450MHz, 10.7dBi @ 5500MHz
- 2) Tyco, 1513461-1, 6 Element Mimo Antenna, 5.41dBi @ 2..4GHz, 5.91dBi @ 5.15GHz, 4.53dBi @ 5.35GHz, 5.55dBi @ 5.5GHz, 5.09dBi @ 5.725GHz. This antenna combined with 10 feet of coax cable with a loss of 2.5 dB results in an effective antenna gain of 3.41 dBi @ 5.15GHz, 2.03dBi @ 2.85GHz, 3.05dBi @ 5.5GHz, and 2.59dBi @ 5.725GHz.

The Tyco antenna is the same antenna that was originally mounted in the WLAN AP 8120. It has been repackaged as an external antenna. DFS testing was performed using the Tyco antenna as it is the lowest gain antenna.

**ENCLOSURE**

The EUT outer enclosure is primarily constructed of metal. It measures approximately 23.5 cm wide by 15 cm deep by 5.5 cm high.

**MODIFICATIONS**

The EUT did not require modifications during testing in order to comply with the requirements of the standard(s) referenced in this test report.

**SUPPORT EQUIPMENT**

The following equipment was used as local support equipment for testing:

| Manufacturer | Model                | Description   | Serial Number      | FCC ID |
|--------------|----------------------|---------------|--------------------|--------|
| Dell         | Latitude E5500       | Laptop        | -                  | -      |
| PowerDsine   | PowerDsine 9001G     | POE Injector  | D0945650000058BA00 | -      |
| <i>Dell</i>  | <i>Inspiron 4150</i> | <i>Laptop</i> | -                  | -      |

The italicized device was the client device.

**EUT INTERFACE PORTS**

The I/O cabling configuration during testing was as follows:

| Port        | Connected To                 | Cable(s)        |                      |            |
|-------------|------------------------------|-----------------|----------------------|------------|
|             |                              | Description     | Shielded/ Unshielded | Length (m) |
| POE         | POE Injector                 | CAT-5           | Unshielded           | 7.0        |
| Serial Port | USB/Serial Adapter to Laptop | CAT-5 to Serial | Unshielded           | 7.0        |

**EUT OPERATION**

The EUT was operating with the following software version loaded. The software is secured by password protection to prevent the user from disabling the DFS function.

Master Device: 1.1.0.122

The manufacturer provided special software that over-rode the non-occupancy mechanism (allowing return to the same channel) for the purposes of determining the probability of detection. This test feature was disabled and the normal operating software enabled for verifying the 30-minute non-occupancy period and channel move time.

The start of the Channel Availability Check was directly after the boot sequence completed.

During the in-service monitoring detection probability and channel moving tests the system was configured with a streaming video file from the master device (sourced by the PC connected to the master device via an Ethernet interface) to the client device.

The streamed file was the “FCC” test file and the client device was using Windows Media Player Classic as required by FCC Part 15 Subpart E

**RADAR WAVEFORMS****Table 1 FCC Short Pulse Radar Test Waveforms**

| Radar Type                  | Pulse Width (μsec) | PRI (μsec) | Pulses / burst | Minimum Detection Percentage | Minimum Number of Trials |
|-----------------------------|--------------------|------------|----------------|------------------------------|--------------------------|

- 1) Tests were performed using the radiated test method.
- 2) The measured detection threshold is based on testing the master device using the radiated test method when connected to an antenna with a nominal gain of 3.0 dBi. The limit is based on an eirp of more than 23 dBm. Testing utilized the 1dB allowance provided by the FCC per Note 2 of Table 3 of FCC-06-96.
- 3) The in-service monitoring detection threshold and detection probability measurements were made with the device operating in the 5500-5700 MHz band.

**MEASUREMENT UNCERTAINTIES**

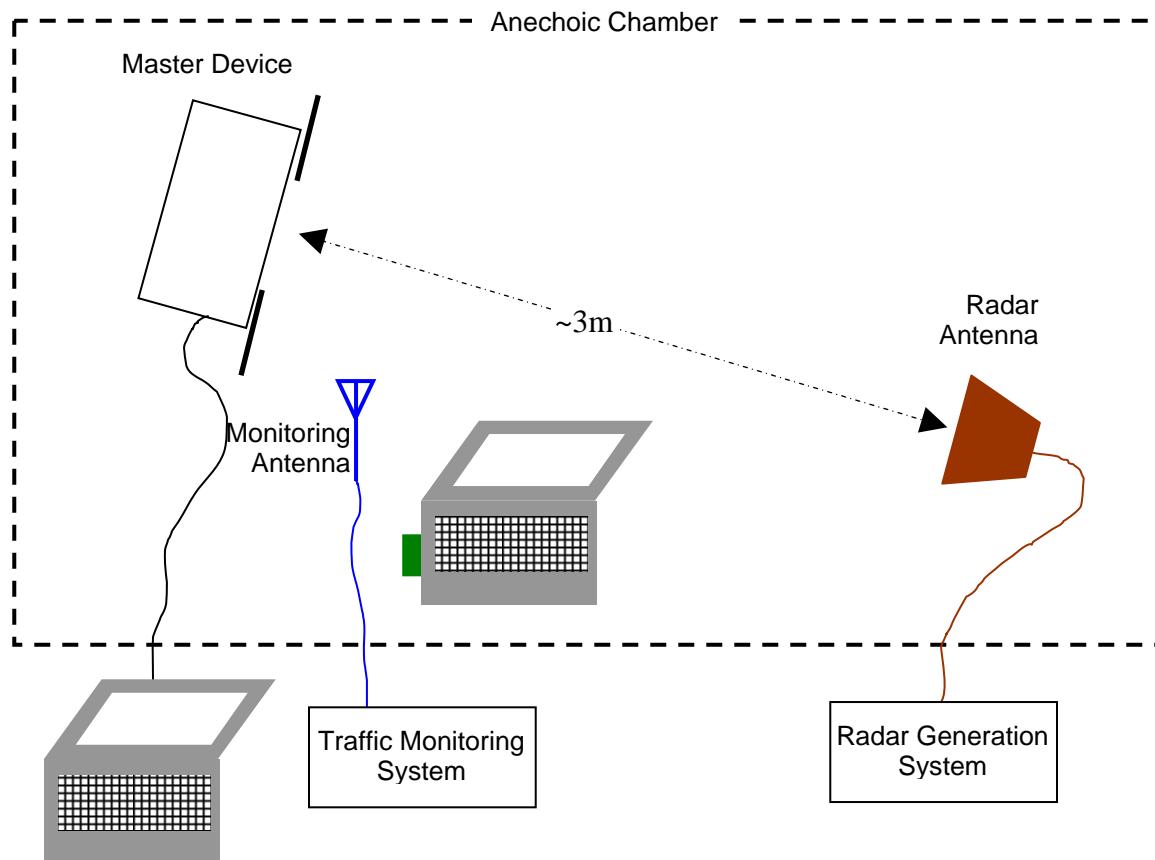

ISO/IEC 17025 requires that an estimate of the measurement uncertainties associated with the emissions test results be included in the report. The measurement uncertainties given below are based on a 95% confidence level, with a coverage factor ( $k=2$ ) and were calculated in accordance with UKAS document LAB 34.

| Measurement  | Measurement Unit | Expanded Uncertainty        |
|--|------------------|-----------------------------|
| Timing<br>(Channel move time, aggregate transmission time) | ms               | Timing resolution +/- 0.24% |
| Timing<br>(non occupancy period)                           | seconds          | 5 seconds                   |
| DFS Threshold (radiated)                                   | dBm              | 1.6                         |
| DFS Threshold (conducted)                                  | dBm              | 1.2                         |

## DFS TEST METHODS

### RADIATED TEST METHOD

The combination of master and slave devices is located in an anechoic chamber. The simulated radar waveform is transmitted from a directional horn antenna (typically an EMCO 3115) toward the unit performing the radar detection (radar detection device, RDD). Every effort is made to ensure that the main beam of the EUT's antenna is aligned with the radar-generating antenna.

**Figure 1 Test Configuration for radiated Measurement Method**

The signal level of the simulated waveform is set to a reference level equal to the threshold level (plus 1dB if testing against FCC requirements). Lower levels may also be applied on request of the manufacturer. The level reported is the level at the RDD antenna and so it is not corrected for the RDD's antenna gain. The RDD is configured with the lowest gain antenna assembly intended for use with the device.

The signal level is verified by measuring the CW signal level from the radar generation system using a reference antenna of gain  $G_{REF}$  (dBi). The radar signal level is calculated from the measured level, R (dBm), and any cable loss, L (dB), between the reference antenna and the measuring instrument:

$$\text{Applied level (dBm)} = R - G_{REF} + L$$

If both master and client devices have radar detection capability then the device not under test is positioned with absorbing material between its antenna and the radar generating antenna, and the radar level at the non RDD is verified to be at least 20dB below the threshold level to ensure that any responses are due to the RDD detecting radar.

The antenna connected to the channel monitoring subsystem is positioned to allow both master and client transmissions to be observed, with the level of the EUT's transmissions between 6 and 10dB higher than those from the other device.

## DFS MEASUREMENT INSTRUMENTATION

### RADAR GENERATION SYSTEM

An Agilent PSG is used as the radar-generating source. The integral arbitrary waveform generators are programmed using Agilent's "Pulse Building" software and Elliott custom software to produce the required waveforms, with the capability to produce both unmodulated and modulated (FM Chirp) pulses. Where there are multiple values for a specific radar parameter then the software selects a value at random and, for FCC tests, the software verifies that the resulting waveform is truly unique.

With the exception of the hopping waveforms required by the FCC's rules (see below), the radar generator is set to a single frequency within the radar detection bandwidth of the EUT. The frequency is varied from trial to trial by stepping in 5MHz steps.

Frequency hopping radar waveforms are simulated using a time domain model. A randomly hopping sequence algorithm (which uses each channel in the hopping radar's range once in a hopping sequence) generates a hop sequence. A segment of the first 100 elements of the hop sequence are then examined to determine if it contains one or more frequencies within the radar detection bandwidth of the EUT. If it does not then the first element of the segment is discarded and the next frequency in the sequence is added. The process repeats until a valid segment is produced. The radar system is then programmed to produce bursts at time slots coincident with the frequencies within the segment that fall in the detection bandwidth. The frequency of the generator is stepped in 1 MHz increments across the EUT's detection range.

The radar signal level is verified during testing using a CW signal with the AGC function switched on. Correction factors to account for the fact that pulses are generated with the AGC functions switched off are measured annually and an offset is used to account for this in the software.

The generator output is connected to the coupling port of the conducted set-up or to the radar-generating antenna.

**CHANNEL MONITORING SYSTEM**

Channel monitoring is achieved using a spectrum analyzer and digital storage oscilloscope. The analyzer is configured in a zero-span mode, center frequency set to the radar waveform's frequency or the center frequency of the EUT's operating channel. The IF output of the analyzer is connected to one input of the oscilloscope.

A signal generator output is set to send either the modulating signal directly or a pulse gate with an output pulse co-incident with each radar pulse. This output is connected to a second input on the oscilloscope and the oscilloscope displays both the channel traffic (via the if input) and the radar pulses on its display.

For in service monitoring tests the analyzer sweep time is set to > 20 seconds and the oscilloscope is configured with a data record length of 10 seconds for the short duration and frequency hopping waveforms, 20 seconds for the long duration waveforms. Both instruments are set for a single acquisition sequence. The analyzer is triggered 500ms before the start of the waveform and the oscilloscope is triggered directly by the modulating pulse train. Timing measurements for aggregate channel transmission time and channel move time are made from the oscilloscope data, with the end of the waveform clearly identified by the pulse train on one trace. The analyzer trace data is used to confirm that the last transmission occurred within the 10-second record of the oscilloscope. If necessary the record length of the oscilloscope is expanded to capture the last transmission on the channel prior to the channel move.

Channel availability check time timing plots are made using the analyzer. The analyzer is triggered at start of the EUT's channel availability check and used to verify that the EUT does not transmit when radar is applied during the check time.

The analyzer detector and oscilloscope sampling mode is set to peak detect for all plots.

## DFS MEASUREMENT METHODS

### DFS RADAR DETECTION BANDWIDTH

The radar detection bandwidth is determined by using FCC radar waveform 1 and applying radar pulses at offsets from the center channel frequency by multiples of 1MHz. These bursts are applied with no traffic on the channel. The first frequencies above and below the center channel frequency that have a detection rate below 90% define the radar bandwidth, the actual range being 1MHz below the upper frequency and 1MHz above the lower frequency.

### DFS - CHANNEL CLOSING TRANSMISSION TIME AND CHANNEL MOVE TIME

Channel clearing and closing times are measured by applying a burst of radar with the device configured to change channel and by observing the channel for transmissions. The time between the end of the applied radar waveform and the final transmission on the channel is the channel move time.

The aggregate transmission closing time is measured in one of two ways:

FCC/KCC Notice No. 2010-48 – the total time of all individual transmissions from the EUT that are observed starting 200ms at the end of the last radar pulse in the waveform. This value is required to be less than 60ms.

ETSI – the total time of all individual transmissions from the EUT that are observed from the end of the last radar pulse in the waveform. This value is required to be less than 260ms.

### DFS - CHANNEL NON-OCCUPANCY AND VERIFICATION OF PASSIVE SCANNING

The channel that was in use prior to radar detection by the master is additionally monitored for 30 minutes to ensure no transmissions on the vacated channel over the required non-occupancy period. This is achieved by tuning the spectrum analyzer to the vacated channel in zero-span mode and connecting the IF output to an oscilloscope. The oscilloscope is triggered by the radar pulse and set to provide a single sweep (in peak detect mode) that lasts for at least 30 minutes after the end of the channel move time.

***DFS CHANNEL AVAILABILITY CHECK TIME***

It is preferred that the EUT report when it starts the radar channel availability check. If the EUT does not report the start of the check time, then the time to start transmitting on a channel after switching the device on is measured to approximate the time from power-on to the end of the channel availability check. The start of the channel availability check is assumed to be 60 seconds prior to the first transmission on the channel.

To evaluate the channel availability check, a single burst of one radar type is applied within the first 2 seconds of the start of the channel availability check and it is verified that the device does not use the channel by continuing to monitor the channel for a period of at least 60 seconds. The test is repeated by applying a burst of radar in the last 2 seconds (i.e. between 58 and 60 seconds after the start of CAC when evaluating a 60-second CAC) of the channel availability check.

***UNIFORM LOADING***

Compliance with the FCC's channel loading requirement is demonstrated through the manufacturer's operational description for the device under test.

***TRANSMIT POWER CONTROL (TPC)***

Compliance with the transmit power control requirements for devices is demonstrated through measurements showing multiple power levels and manufacturer statements explaining how the power control is implemented.

## SAMPLE CALCULATIONS

### DETECTION PROBABILITY / SUCCESS RATE

The detection probability, or success rate, for any one radar waveform equals the number of successful trials divided by the total number of trials for that waveform.

In the case of the FCC requirements, for radar waveform types 1 through 4 an additional calculation is made to determine the average detection probability over all four radar waveform types. This calculation is the arithmetic mean of the four individual probabilities.

### THRESHOLD LEVEL

The threshold level is the level of the simulated radar waveform at the EUT's antenna. If the test is performed in a conducted fashion then the level at the rf input equals the level at the antenna plus the gain of the antenna assembly, in dBi. The gain of the antenna assembly equals the gain of the antenna minus the loss of the cabling between the rf input and the antenna. The lowest gain value for all antenna assemblies intended for use with the device is used when making this calculation.

If the test is performed using the radiated method then the threshold level is the level at the antenna.

**Appendix C Test Data Tables and Plots for Channel Closing****FCC PART 15 SUBPART E Channel Closing Measurements****Table 82 FCC Part 15 Subpart E Channel Closing Test Results**

| Waveform Type              | Channel Closing Transmission Time <sup>1</sup> |       | Channel Move Time |       | Result |
|----------------------------|--|-------|-------------------|-------|--------|
|                            | Measured                                       | Limit | Measured          | Limit |        |
| Radar Type 1 (20 MHz mode) | 19.4 ms  | 60 ms | 3.97 s            | 10 s  | PASS   |
| Radar Type 1 (40 MHz mode) | 22.2 ms  | 60 ms | 4.10 s            | 10 s  | PASS   |
| Radar Type 5 (20 MHz mode) | 0 ms   | 60 ms | 0 s               | 10 s  | PASS   |
| Radar Type 5 (40 MHz mode) | 0 ms   | 60 ms | 0 s               | 10 s  | PASS   |

After the final channel closing test the channel was monitored for a further 30 minutes. No transmissions occurred on the channel.

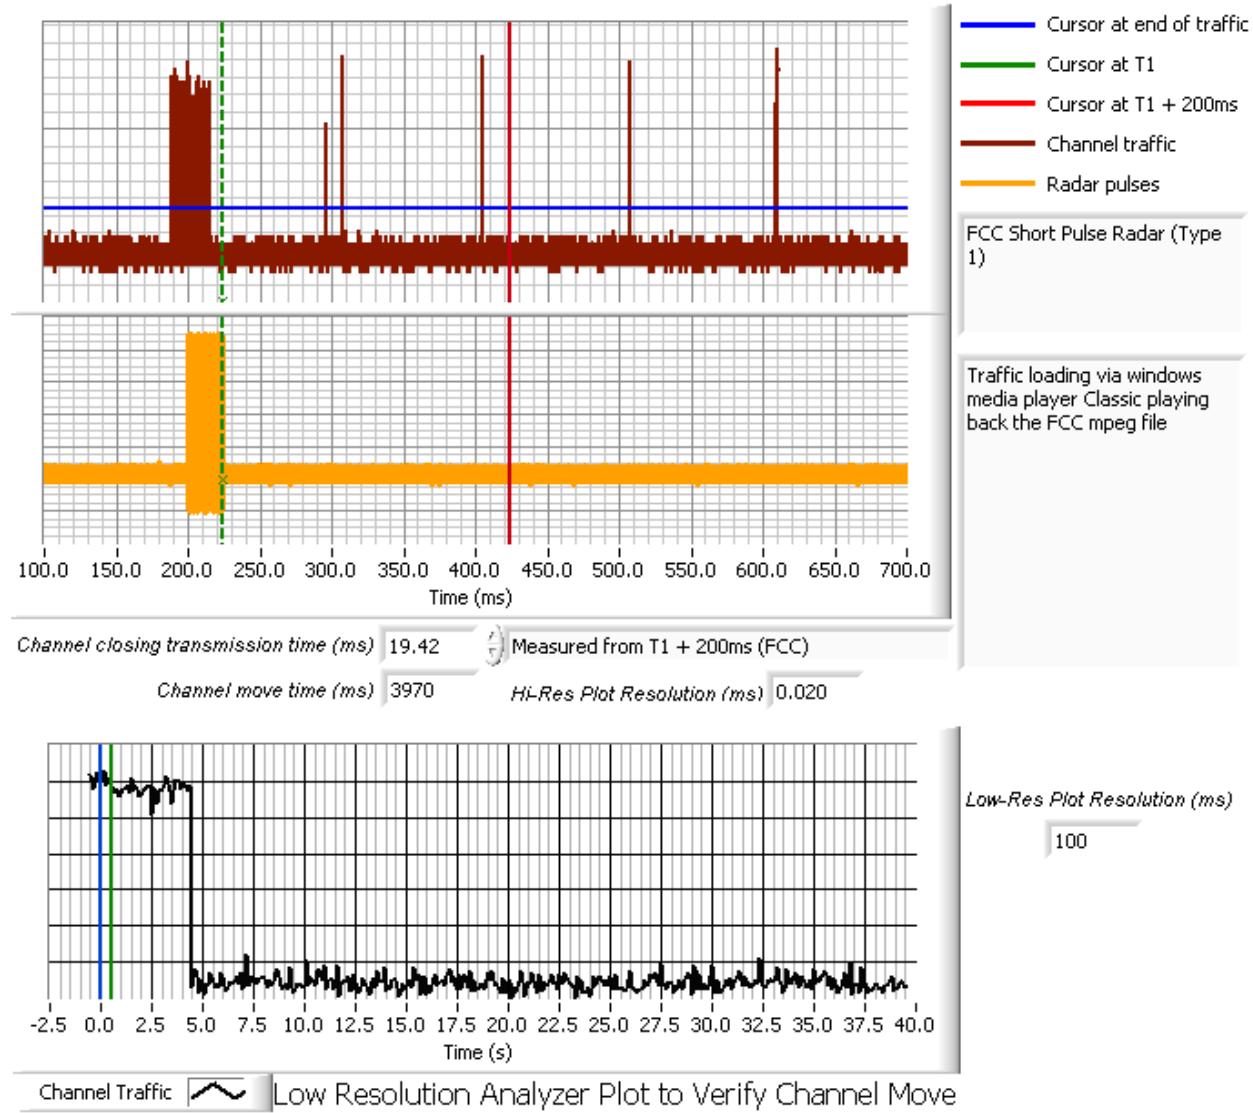

<sup>1</sup> Channel closing time for FCC measurements is the aggregate transmission time starting from 200ms after the end of the radar signal to the completion of the channel move.

## Elliott Timing Plots - Channel Closing

**Figure 2 Channel Closing Time and Channel Move Time – 20 MHz mode Type 1**

## Elliott Timing Plots - Channel Closing

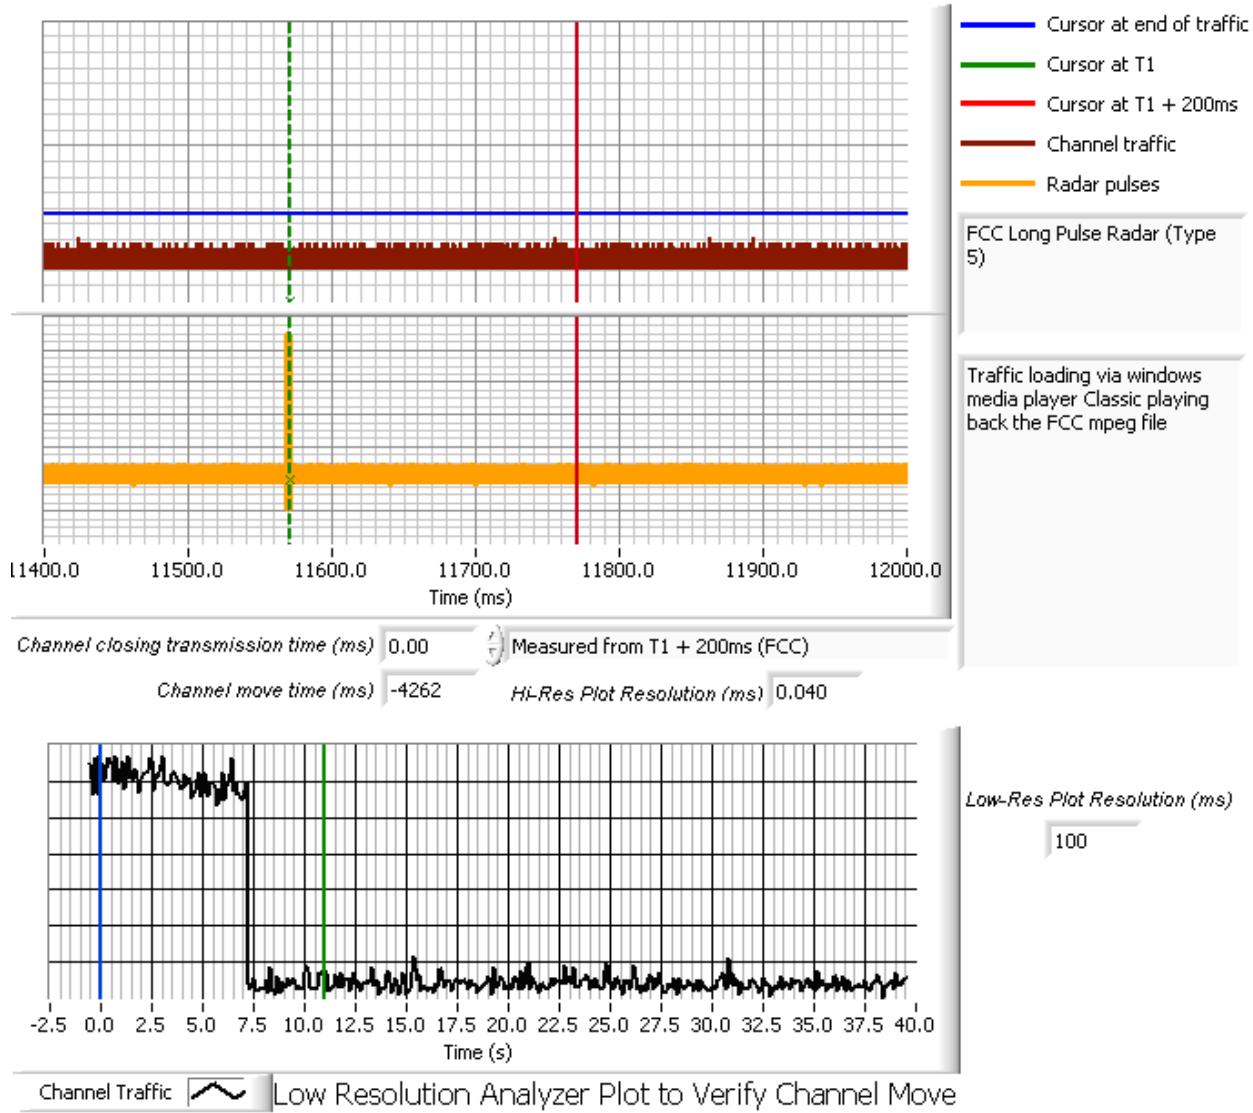

**Figure 3 Close-Up of Transmissions Occurring More Than 200ms After The End of Radar**

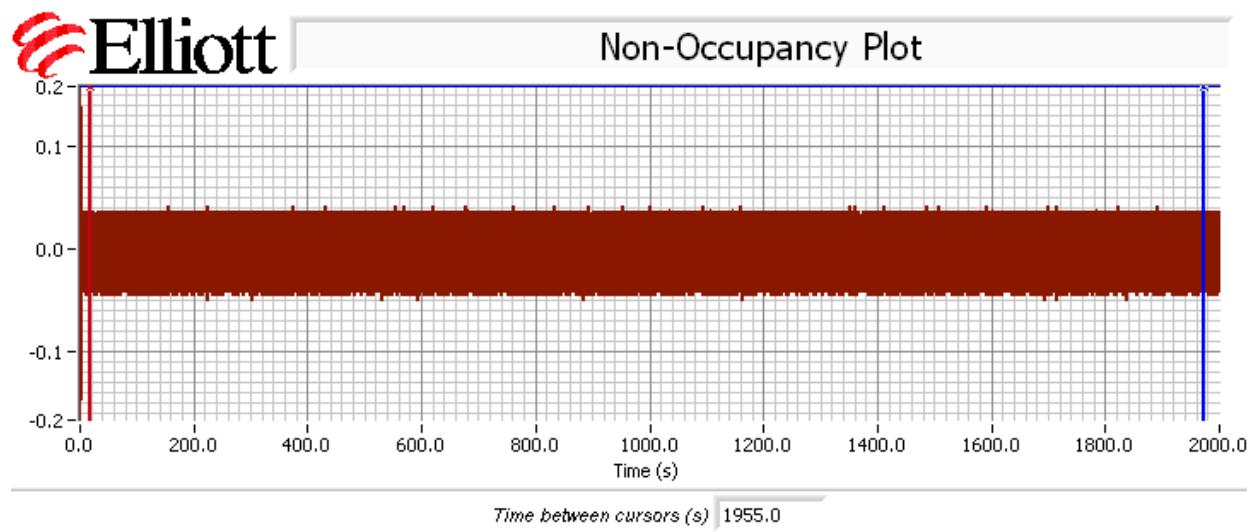

**Figure 4 Channel Closing Time and Channel Move Time – 20 MHz mode Type 5**

# Elliott Timing Plots - Channel Closing

**Figure 5 Close-Up of Transmissions Occurring More Than 200ms After The End of Radar**

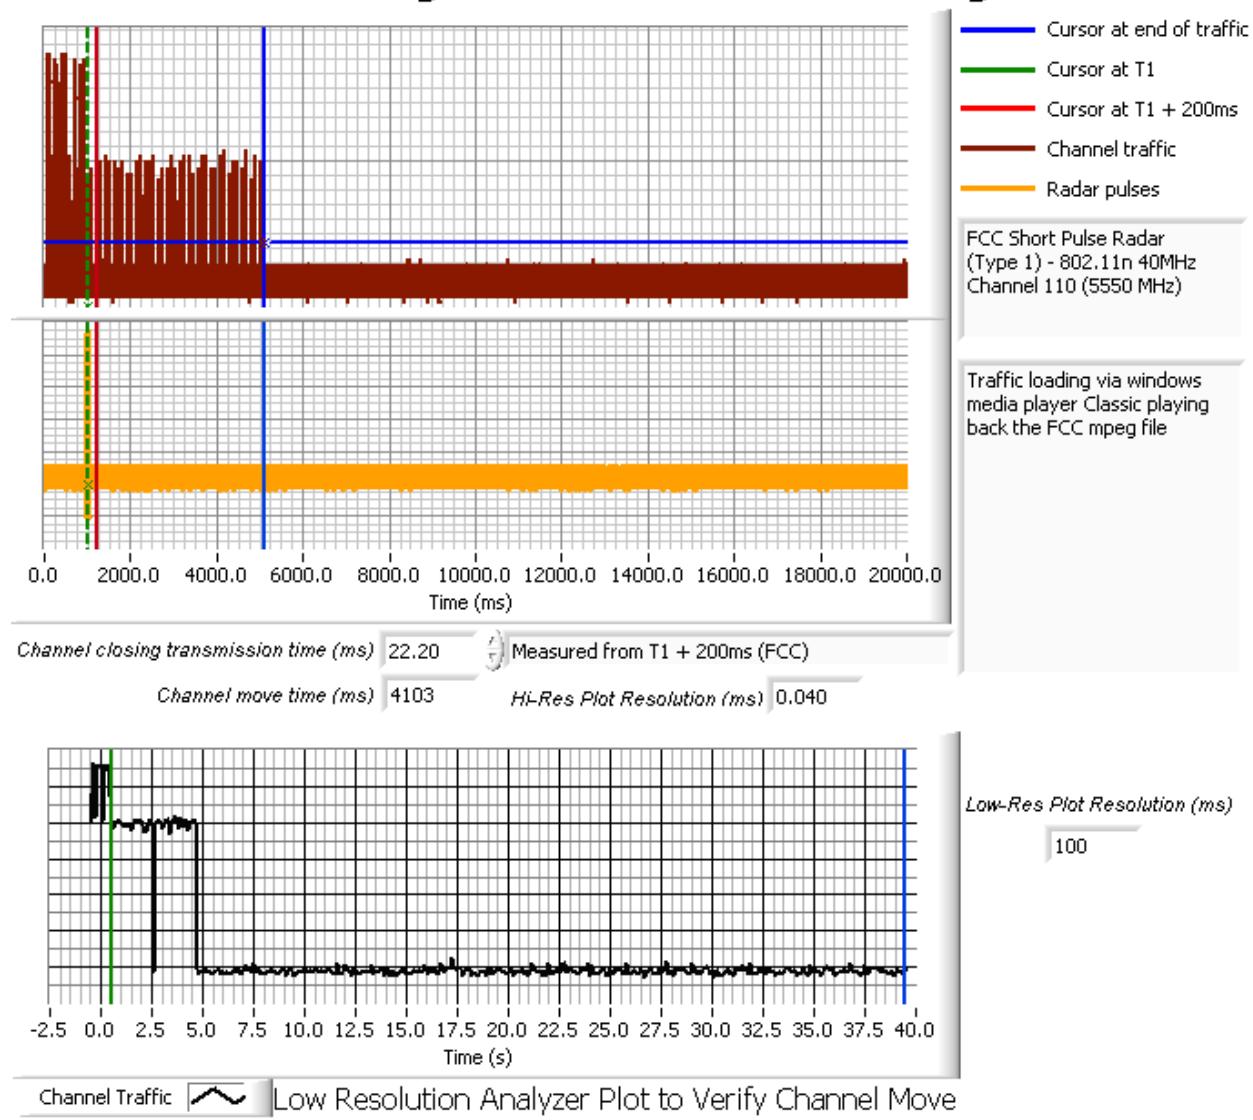

5540 MHz monitored immediately before, during and for a minimum of 30 minutes following the channel move. Plot shows channel traffic prior to channel move and no traffic on the vacated channel after the channel move.

**Figure 6 Radar Channel Non-Occupancy Plot 20 MHz mode**

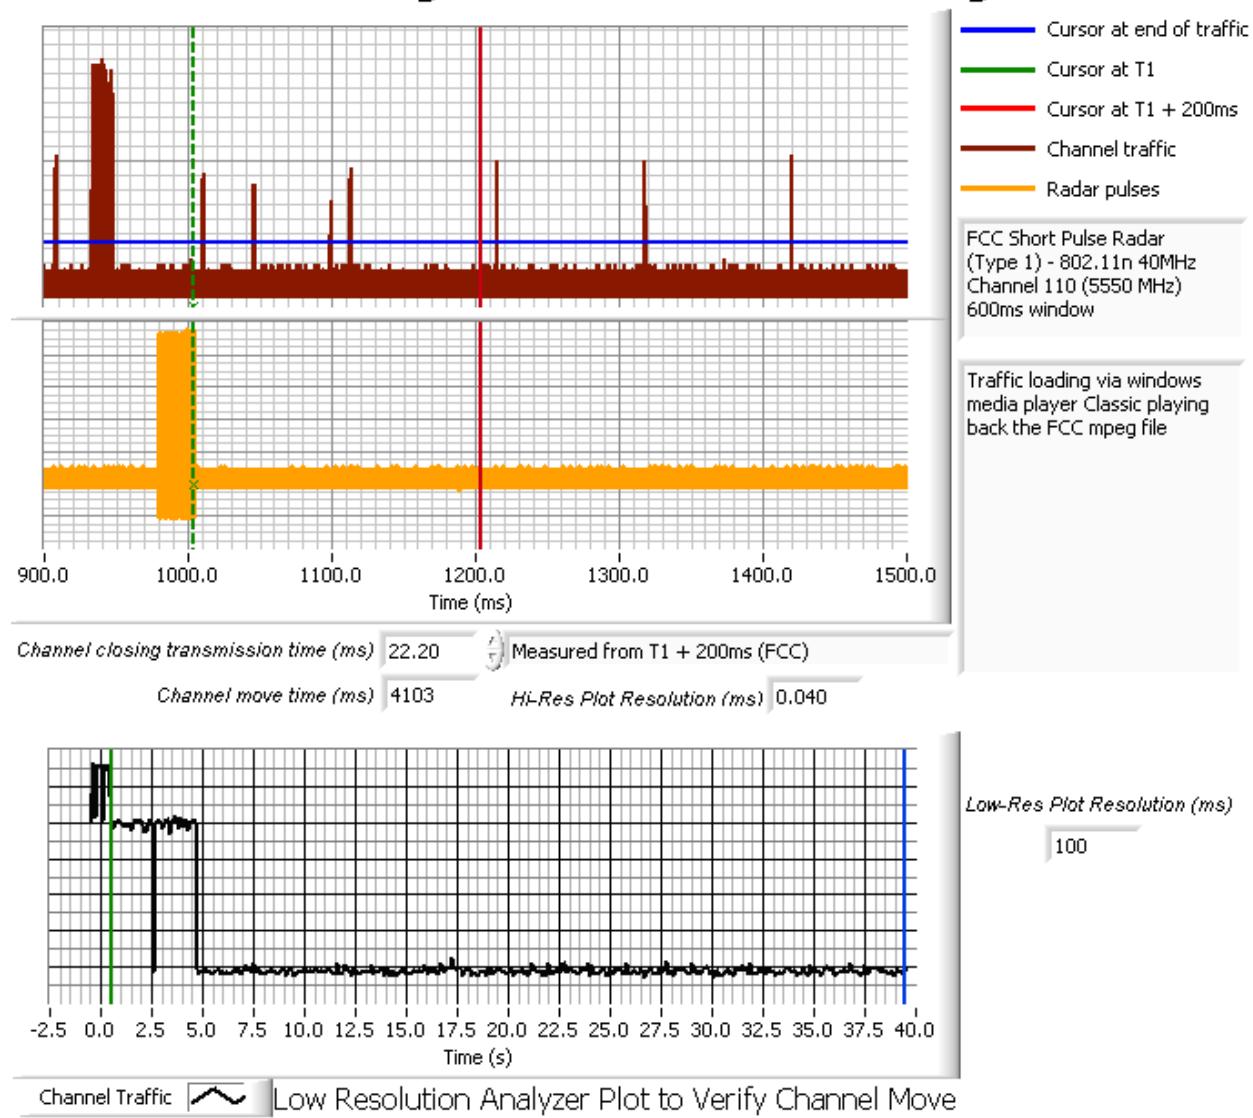

The non-occupancy plot was made over a 30-minute time period following the channel move time with the analyzer IF output connected to the scope and tuned to the vacated channel. No transmissions were observed after the channel move had been completed.

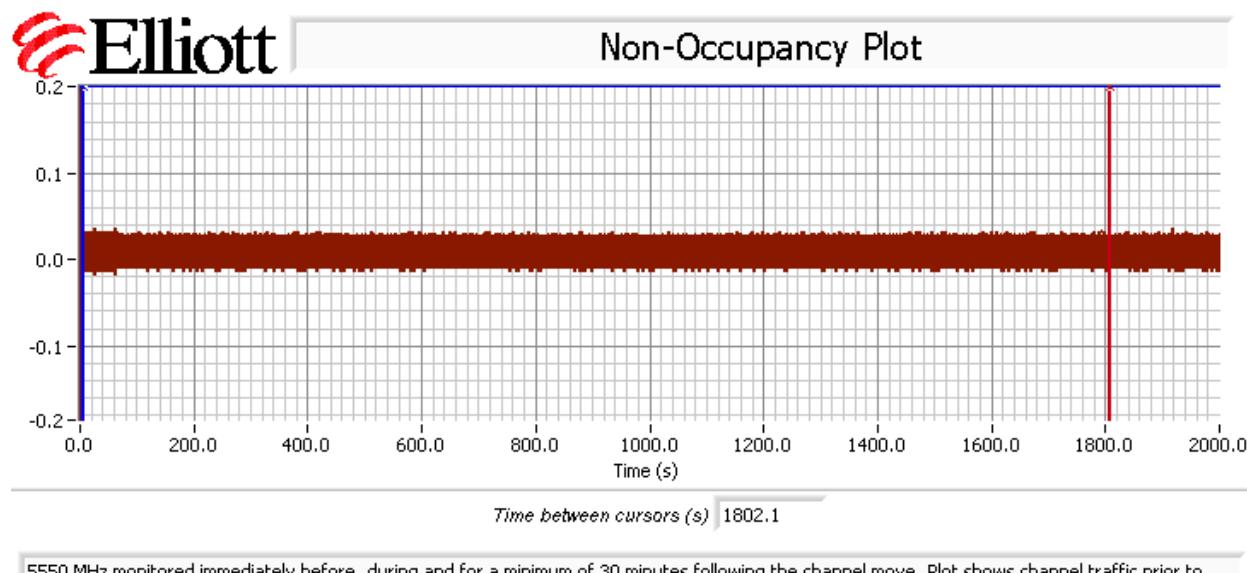

**Figure 9 Channel Closing Time and Channel Move – 40 MHz mode Type 5**

# Elliott Timing Plots - Channel Closing

**Figure 10 Close-Up of Transmissions Occurring More Than 200ms After The End of Radar**

5550 MHz monitored immediately before, during and for a minimum of 30 minutes following the channel move. Plot shows channel traffic prior to channel move and no traffic on the vacated channel after the channel move.

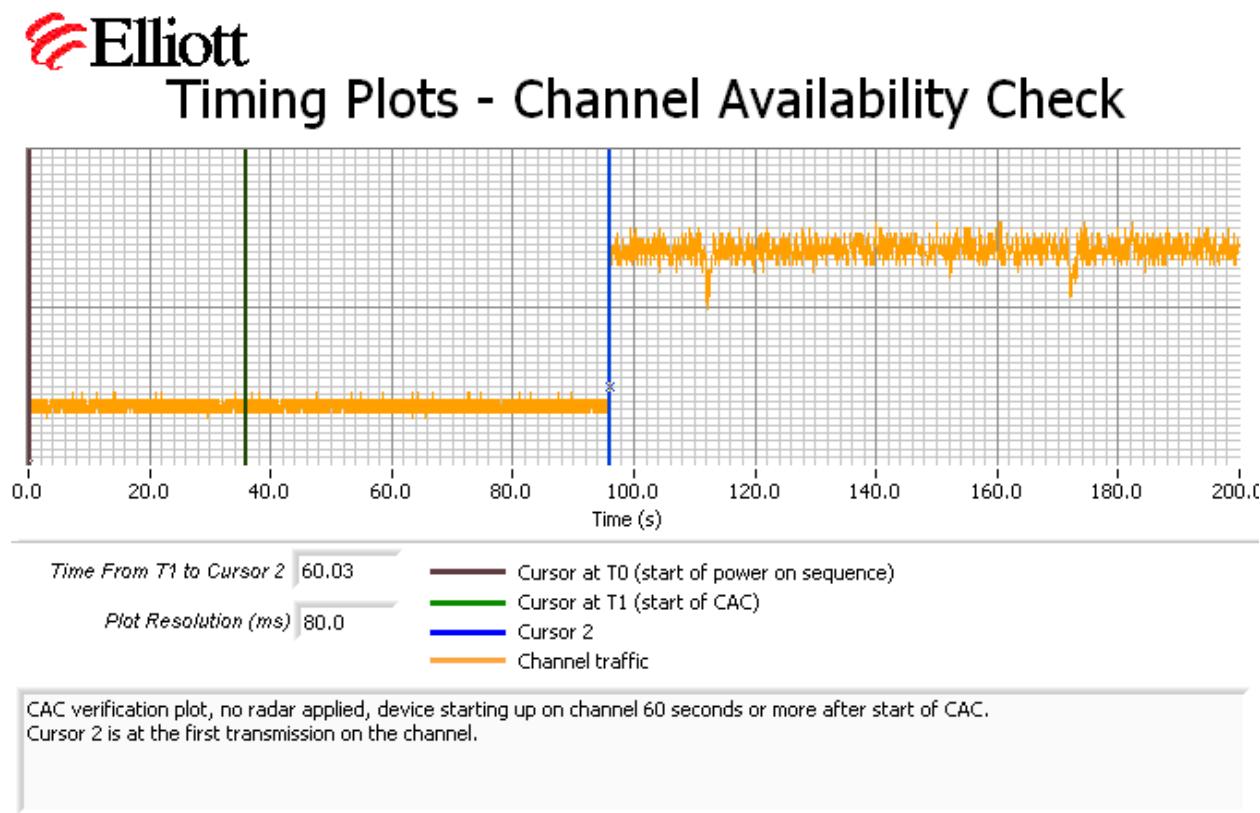

**Figure 11 Radar Channel Non-Occupancy Plot – 40 MHz mode**

The non-occupancy plot was made over a 30-minute time period following the channel move time with the analyzer IF output connected to the scope and tuned to the vacated channel. No transmissions were observed after the channel move had been completed.

**Appendix D Test Data – Channel Availability Check**

5250- 5350 MHz, 5470 – 5725 MHz

The first plot shows the first transmissions on a channel after restarting/power cycling the master device, with no radar applied during the CAC. The start of CAC is assumed to be 60 seconds before the first transmission as indicated by the green cursor line.

**Figure 12 Plot of EUT Start-Up After CAC**

The channel availability check (CAC) was made by applying type 1 radar during either the first 6 seconds or last 6 seconds of the CAC period.

The level of the radar signal applied was -63dBm. Measurements were made on channel 108 (5540 MHz).

The start time is the same for each of the plots and the green cursor is positioned to coincide with the start of the Channel Availability Check period based on the plot taken with no radar applied during the CAC.

The plots show that there were no transmissions on the channel after the radar burst was applied during the CAC, and confirm that the CAC is at least 60 seconds. The description of “Channel Traffic” in the plot legend indicates the transmissions from both the radar system and the EUT on the start-up channel. In all cases only the radar burst is observed. The resolution of the plot is not fine enough to resolve the individual pulses within the burst.

**Appendix E Antenna Specification Sheet**

- Frequency: 2.4 – 2.485 and 4.9 – 5.9 GHz.
- Gain: <6 dBi Max
- VSWR: <2.5:1
- Polarization: Linear
- Power: 2 watts Max
- Impedance: 50 ohms (typical)
- Cables: 6X 1.13 diam.
- Connectors: 6X reverse SMA or equivalent
- Temperature: +65°C operating and storage

**Overall Peak Gain**

| Freq MHz | Gain dBi |
|----------|----------|
| 5850     | 3.02     |
| 5725     | 2.59     |
| 5500     | 3.05     |
| 5350     | 2.03     |
| 5150     | 3.41     |
| 4900     | 2.05     |
| 2483     | 2.62     |
| 2440     | 2.91     |
| 2400     | 2.87     |
