2 Description of the radiated emission test

2.1 Test Procedure

Radiated emissions measurements are investigated and taken pursuant to the procedures of ANSI C63.10 – 2013.

A non-conductive turntable with dimensions of 1.5m x 0.4m x 0.8m (L x W x H) placed above the reference ground plane. The equipment under test (EUT) was placed at 0.8m height for below 1GHz measurement and 1.5m height for above 1GHz measurement. The test distance is 3m between EUT and receiving antenna. A broadband antenna mounting on the mast received the signal strength. The turntable was rotated to maximize the emission level. The antenna was moving along the mast from 1m up to 4m until no more higher value was found. Both horizontal and vertical polarization of the antenna were placed and investigated. Additional absorbing material will be placed between the EUT and receiving antenna for above 1GHz measurement.

For below 30MHz, a loop antenna with its vertical plane is placed 3m from the EUT and rotated about its vertical axis for maximum response at each azimuth about the EUT. And the centre of the loop shall be 1 m above the ground.

The device was rotated through three orthogonal axes to determine which attitude and configuration produce the highest emission during measurement.

2.3 Test Result

Peak Detector data was measured unless otherwise stated.

The radiated emissions are measured from 9kHz to 4GHz (the tenth harmonics)

The worst case configuration is shown on the worst case configuration of test setup photo.

"#" means emissions appearing within the restricted bands of 47 CFR Part 15 section 15.205 and "*" means emission appearing within the restricted bands of RSS-GEN section 8.10.

The frequencies from fundamental up to tenth harmonics were investigated, and emissions more 20dB below limit were not reported. Thus, those highest emissions were presented in next pages.

The EUT has been tested in Transmission mode.

It was found that the EUT meet the FCC and RSS requirement.

4.1 Bandwidth

Appendices A1 is shown the fundamental emission is confined in the specified band. The 20dB bandwidth is 560.4kHz and 99% bandwidth is 699.3kHz. The bandwidth requirement is 0.25% of 313MHz = 782.5kHz . It also shows that the EUT met the FCC Part 15.231(c) and RSS-210 Annex A1.1.3 bandwidth requirement.

4.2 Duty cycle

Since the device has difference code from switch 1, switch 2, Dip switch and three buttons; and all combination of three switch are checked, the worst case duty cycle is used for the average factor calculation.

Worst case at following setting:
Knob switch 1: ‘A’, Knob switch 2: ‘1’, Dip switch: ‘00000000’, “Open” button ON

The duty cycle is simply the on-time divided by the period:

Time duration of one cycle = 100 ms

Effective period of one cycle = (8 x 0.3 + 5 x 0.59) x 5 ms
= 26.75 ms

Duty Cycle = (26.75 ÷ 100) ms
= 0.2675

Therefore, the average correction factor is found by $\underline{20 \log_{10}} 0.2675 = -11.5$dB

4.3 Transmission time

All combination of knob switch 1, knob switch 2, dip switch and 3 buttons are checked and the following worst case found.

Worst case at following setting:
Knob switch 1: ‘A’, Knob switch 2: ‘1’, Dip switch: ‘00000000’, “OPEN” button ON

Duration of each transmission =0.3475s

The duration of the transmission is less than 5s after the transmission is activated by remote controller. An Appendices A3 is shown the EUT to comply with FCC part 15, section 15.231(a)(1) and RSS-210, Annex 1, section A1.1.1.
