FCC TAS validation - Part 2:

Tests under dynamic transmit power scenarios

The following samples were submitted and identified on behalf of the client as:

Equipment Under Test Smart Phone Model No. Celero3 5G+

Applicant Shenzhen Tinno Mobile Technology Corp.

27-001, South Side of Tianlong Mobile Headquarters

Building, Tongfa South Road, Xili Community, Xili Street, Nanshan District, Shenzhen ,PRC

XD6U695DS

Date of Receipt Sep. 28, 2022

Date of Test(s) Sep. 30, 2022 ~ Oct. 12, 2022

Date of Issue Oct. 20, 2023

In the configuration tested, the EUT complied with the standards specified above.

FCC ID

This report details the results of the testing carried out on one sample, the results contained in this test report do not relate to other samples of the same product. The manufacturer should ensure that all products in series production are in conformity with the product sample detailed in this report.

This report may only be reproduced and distributed in full. If the product in this report is used in any configuration other than that detailed in the report, the manufacturer must ensure the new system complies with all relevant standards. Any mention of SGS Taiwan Ltd. Central RF Lab or testing done by SGS Taiwan Ltd. Central RF Lab in connection with distribution or use of the product described in this report must be approved by SGS Taiwan Ltd. Central RF Lab in writing.

Signed on behalf of SGS

2. Overview

FCC regulation allows time averaged RF power to demonstrate compliance to RF exposure safety limits. Because RF exposure is correlated to transmission power (TX power), e.g., lower RF exposure is correlated to lower TX power, the TX power can be controlled to meet FCC RF exposure limits defined specific absorption rate (SAR) limit for transmit frequencies < 6GHz. For SAR limit, the proposed Time-Averaged Specific Absorption Rate (TA-SAR) algorithm manages TX power to ensure that at all times the time-averaged RF exposure is compliant with the FCC SAR requirement. In the FCC regulation, the averaging window of SAR is 100 seconds for transmit frequencies less than 3GHz, 60 seconds for transmit frequencies between 3GHz and 6GHz.

This document describes the test plan, test procedures, measurement setup, and measurement results for the verification of the proposed TA-SAR/TA-PD algorithm being able to make RF exposure meet FCC requirement.

The equipment under test (EUT) is a mobile phone, it contains supports 2G/3G/4G/5G bands. These modems are enabled with MediaTek TAS feature to control and manage transmitting power in real time and to ensure at all times the time-averaged RF exposure is in compliance with the FCC requirement.

This purpose of the Part 2 report is to demonstrate the EUT complies with FCC RF exposure requirement under Tx varying transmission scenarios, thereby validity of MediaTek TAS feature for FCC equipment authorization

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

3. MediaTek TAS feature Operation Description

3.1 Operating Parameters for Algorithm Validation

Mediatek developed the TA-SAR algorithm to control instantaneous TX power for transmit frequencies less than 6GHz, so that the time-averaged RF exposures are less than FCC requirement. TA-SAR algorithm validation has been performed for 2G, 3G, LTE, 5G NR according to cases with different combinations of operating parameters listed in Table 3-1.

Table 3-1 TA-SAR operating parameters

Operating parameters	Description
P_{sub6_limit}	The time-averaged maximum power level limit for different band in sub6.
$P_{LowThresh_offset}$	To calculate $P_{LowThresh}$. $(P_{LowThresh} = P_{sub6_limit} - P_{LowThresh_offset})$
$P_{\mathit{UE_backoff_offset}}$	To calculate $P_{UE_backoff}$. $(P_{UE_backoff} = P_{sub6_limit} - P_{UE_backoff_offset})$
$P_{UE_max_cust_offset}$	To calculate $P_{UE_max_cust}$. P_{UE_max} is maximum TX power at which a UE can possibly transmit in sub6. $P_{UE_max_cust} = \min \left(P_{UE_max}, P_{sub6_limit} + P_{UE_max_cust_offset} \right)$

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

Page: 8 of 89

3.2 Overview of TA-SAR Test Proposal

For the completeness of verifying that the proposed TA-SAR algorithm can realize FCC compliance regarding RF exposure, several test scenarios are constructed as below:

Scenario 1: test under different TA-SAR parameters to verify that the TA-SAR algorithm meets compliance requirements with different combinations of operating parameters.

Scenario 2: test under time-varying TX power to verify that the TA-SAR algorithm ensures SAR compliance through dynamic TX power.

Scenario 3: test under call drop and re-establishment conditions to ensure the TA-SAR algorithm control continuity and SAR compliance.

Scenario 4: test under RAT/band handover to ensure the TA-SAR algorithm control continuity and correctness.

Scenario 5: test under different ECIs (Exposure Condition Index) to ensure the TA-SAR algorithm control behaves as expected during ECI switching from one ECI to another. (e.g., head-body worn)

Scenario 6: test under different transmission antennae to ensure the TA-SAR algorithm control works correctly during antenna switching from one antenna to another.

Scenario 7: test under different time windows to ensure the TA-SAR algorithm control functions correctly during time window switching from one time window setting to another. (e.g., time window 100s→60s)

Scenario 8: test under SAR exposure switching between two active radios (radio#1 only, radio#1+radio#2, and radio#2 only) to ensure the TA-SAR algorithm control continuity and SAR compliance.

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

4. TA-SAR Test Scenarios and Test Procedures

In order to demonstrate that TA-SAR algorithm performs as expected under various operating scenarios, Table 4-1 lists the test scenarios and expected test sequences to validate TA-SAR algorithm in these scenarios. The test sequences 0, 1, 2 are defined in section 4.1. The details of each test procedures via conducted power and SAR measurements are described in section 4.2~4.9 and section 4.10, respectively.

Table 4-1 Test scenario list of TA-SAR validation

	Test scenario	Test sequences #	Description
1	Range of TA-SAR parameters	0	Adjust parameters
2	Time-varying TX power	1 and 2	Test under time-varying TX power
3	Call disconnection and re- establishment	0	Test call drop and re- establishment
4	Band handover	0	Test band change
5	ECI (Exposure Condition Index) change	0	Test under ECI transition (e.g., head → body worn)
6	Antenna switching	0	Change antenna
7	Time window switching	0	Switch frequency bands with larger frequency separation (e.g., time window 100s—>60s)
8	SAR exposure switching	0	Switch RATs when testing (e.g., LTE—→NR)

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

4.1 Test Sequences for All Scenarios

Three test sequences having possibly time-varying TX power are predefined for TA-SAR validation:

- Test sequence 0: EUT's TX power is requested to be maximum.
- Test sequence 1: EUT's TX power is requested to be at power less than PLOWThresh for 300s, then at maximum power for 200s, and finally at PLowThresh - 2dB for the remaining time.
- Test sequence 2: EUT's TX power to vary with time. This sequence is generated relative to measured Pue_max, measured Psub6_limit and calculated Pue_backoff (= measured Psub6_limit in dBm - PUE backoff offset in dB) of EUT based on measured Psub6 limit.
- Test sequence is generated based on below parameters of the EUT:
 - A. Measured maximum power (PUE_max)
 - B. Measured Tx power at SAR design limit (Psub6_limit)
 - C. Threshold of dynamic power reduction status determination: reserve hysteresis margin for instantaneous power (*PLowThresh*)
 - D. SAR_time_window (FCC: 100s for f < 3GHz, 60s for 3GHz < f <6GHz)

The test sequence 0, 1, and 2 are illustrated in Figure 4-1, Figure 4-2, and Figure 4-3, respectively. The waveforms of the three test sequences are listed in Table 4-2, Table 4-3, and Table 4-4.

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

4.2 Test Configuration and Procedure for Scenario 1: Range of TA-SAR Parameters via **Conducted Power Measurements**

4.2.1 Configuration

This test is performed by changing the parameters (PLowThresh_offset, PUE_backoff_offset, PUE_max_cust_offset) for the selected RAT (Radio Access Technologies) and band. Since

t (886-2) 2299-3279

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。
This document is issued by the Company subject to its General Conditions of Service printed overleaf, available on request or accessible at http://www.sgs.com.tw/Terms-and-Conditions and for electronic format documents, subject to Terms and Conditions for Electronic Documents at http://www.sgs.com.tw/Terms-and-Conditions. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein. The Company's sole responsibility is to its Client and this document does not exonerate parties to a transaction from exercising all their rights and obligations under the transaction documents. This document cannot be reproduced except in full, without prior written approval of the Company. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

Page: 15 of 89

Mediatek's TA algorithm operation is independent of RATs/bands/channels, any one RAT can be selected for this test and the selected band of the RAT has the least Psub6_limit. In principle, two sets of the parameters are determined for this test (if applicable). If the parameters of the EUT are fixed (without a support of dynamic change), only the set of the default parameters needs to be tested.

4.2.2 Procedure

TX power is measured, recorded, and processed by the following steps:

• Step 1~4: measure and record TX power versus time for test scenario 1

Measure Step 1

Measure Psub6 limit for the selected RAT/band. Measure Psub6 limit with TA-SAR enabled and $P_{UE_backoff_offset}$ set to 0 dB, callbox set to request maximum power.

Step 2 Setting

Establish link Step 3

Step 4

Establish radio link with callbox in the selected RAT/band.

Measure and record the conducted Tx power versus time for the full duration of this test

Test sequence

- Configure callbox to request the EUT's Tx power to be at 0 dBm at least one time window
- Then request pre-defined test sequence 0 (max power) for a certain time

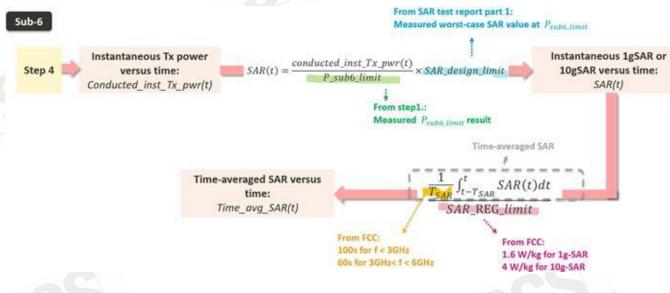

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

This document is issued by the Company subject to its General Conditions of Service printed overleaf, available on request or accessible at http://www.sgs.com.tw/Terms-and-Conditions and for electronic format documents, subject to Terms and Conditions for Electronic Documents at http://www.sgs.com.tw/Terms-and-Conditions. This document cannot be reproduced except in full, without prior written approval of the Company. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

Page: 16 of 89

 Step 5: convert the measured conducted TX power into SAR Convert the measured conducted TX power from step 4 into 1gSAR or 10gSAR value using the following equation. Perform the running time average to power and 1gSAR or 10g SAR to determine time-averaged value versus time as follows,

- Step 6: plot results
 - A. Make one power perspective plot containing
 - 1. Instantaneous TX power
 - 2. Requested power
 - 3. Calculated time-averaged power
 - 4. Calculated time-averaged power limits
 - B. Make one SAR perspective plot containing
 - 1. Calculated time-averaged 1gSAR or 10gSAR
 - 2. FCC limit of 1.6 W/kg (1gSAR) or 4.0 W/kg (10gSAR)

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。
This document is issued by the Company subject to its General Conditions of Service printed overleaf, available on request or accessible at http://www.sgs.com.tw/Terms-and-Conditions and for electronic format documents, subject to Terms and Conditions for Electronic Documents at http://www.sgs.com.tw/Terms-and-Conditions. Page: 17 of 89

4.3 Test Configuration and Procedure for Scenario 2: Time-Varying TX Power via **Conducted Power Measurements**

4.3.1 Configuration

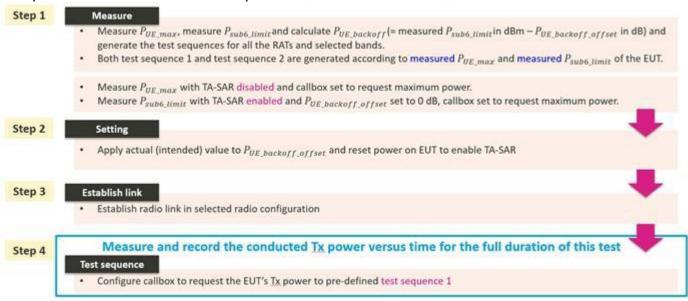

Since Mediatek's TA-SAR feature operation is independent of bands and channels for a given RAT, selecting one band per RAT is sufficient to validate this feature. Two bands per RAT are proposed for this test. The criteria for band selection for each RAT is based on the Psub6_limit values (corresponding to SAR_design_limit) and is described as below:

- Select two bands, among the ones whose P_{Sub6_limit} values are below P_{UE_max} , which correspond to least and highest Psub6_limit values respectively.
 - o Only one band needs to be tested if all the bands have same Psub6 limit.
 - o Only one band needs to be tested if only the band has Psub6_limit below PUE_max.
 - o If the same least Psub6_limit applies to multiple bands, select the band with the highest measured 1gSAR at Psub6_limit.
 - o If P_{sub6_limit} values of all bands are all over P_{UE_max} (i.e., TA-SAR feature is not enabled), there is no need to test this RAT.

4.3.2 Procedure

TX power is measured, recorded, and processed by the following steps:

Step 1~4: measure and record TX power versus time for test scenario 2

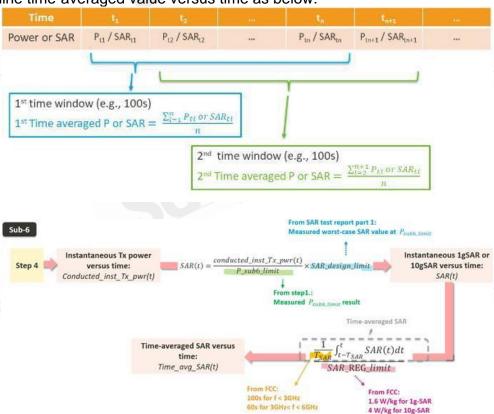

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

This document is issued by the Company subject to its General Conditions of Service printed overleaf, available on request or accessible at http://www.sgs.com.tw/Terms-and-Conditions and for electronic format documents, subject to Terms and Conditions for Electronic Documents at http://www.sgs.com.tw/Terms-and-Conditions. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein. Any holder of this document is advised that information contained hereon reflects the Company's findings at the time of its intervention only and within the limits of Client's instructions, if any. Page: 18 of 89

 Step 5: convert the measured conducted TX power into SAR Convert the measured conducted TX power from step 4 into 1gSAR or 10gSAR value using the following equation. Perform the running time average to power and 1gSAR or 10g SAR to determine time-averaged value versus time as below:

- · Step 6: plot results
 - A. Make one power perspective plot containing
 - 1. Instantaneous TX power
 - 2. Requested power (test sequence1)
 - 3. Calculated time-averaged power
 - 4. Calculated time-averaged power limits
 - B. Make one SAR perspective plot containing
 - 1. Calculated time-averaged 1gSAR or 10gSAR
 - 2. FCC limit of 1.6 W/kg (1gSAR) or 4.0 W/kg (10gSAR)
- Step 7: repeat steps 2~6 for test sequence 2 Repeat steps 2 ~ 6 for pre-defined test sequence 2 and replace test sequence 1 in step 4 with test sequence 2.
- Step 8: repeat steps 2~7 for different bands

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

Page: 19 of 89

4.4 Test Configuration and Procedure for Scenario 3: Call Disconnection and Re-establishment via Conducted Power Measurements

4.4.1 Configuration

For call disconnection measurement, the criteria of selecting the test configuration is:

- Select the RAT/band with least *Psub6 limit* among all supported RATs/bands.
- Select the RAT/band having the highest measured 1gSAR at Psub6_limit if multiple RATs/bands having same least Psub6 limit.
- Select the radio configuration in this RAT/band that corresponds to the highest measured 1gSAR at Psub6 limit.

4.4.2 Procedure

TX power is measured, recorded, and processed by the following steps:

Step 1~4: measure and record TX power versus time for test scenario 3

Measure / setting

Step 1

 Measure P_{sub6_limit} with TA-SAR enabled and P_{UE_backoff_offset} set to 0 dB for the selected RAT/band, then callbox set to request maximum power.

Step 2

Apply actual (intended) value to $P_{UE_backoff_offset}$ and reset power on EUT to enable TA-SAR

Step 3

Establish radio link in the selected RAT/band with callbox.

Step 4

Measure and record the conducted Tx power versus time for the full duration of this test

Initial request

- Request EUT's Tx power at 0 dBm for at least one time window specified for the selected RAT/band
- Then request EUT's Tx power to be at maximum power for at least one time window.

Drop the call

Drop the call for ~10 seconds.

Re-establish

- Re-establish another call in the same radio configuration as first link (i.e., same RAT/band/channel)
- For the remaining time, continue callbox requesting EUT's Tx power to be at maximum power for at least one time window.

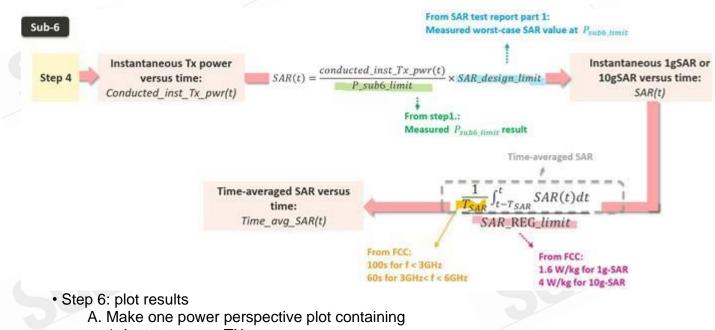

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

Page: 20 of 89

 Step 5: convert the measured conducted TX power into SAR Convert the measured conducted TX power from step 4 into 1gSAR or 10gSAR value using the following equation. Perform the running time average to power and 1gSAR or 10g SAR to determine time-averaged value versus time as follows,

- 1. Instantaneous TX power
- 2. Requested power
- 3. Calculated time-averaged power
- 4. Calculated time-averaged power limits
- B. Make one SAR perspective plot containing
 - 1. Calculated time-averaged 1gSAR or 10gSAR
 - 2. FCC limit of 1.6 W/kg (1gSAR) or 4.0 W/kg (10gSAR)

4.5 Test Configuration and Procedure for Scenario 4: Band Handover via Conducted **Power Measurements**

4.5.1 Configuration

For a given TX antenna, select a RAT/band with the lowest Psub6_limit and the other RAT/band with the highest Psub6_limit. Both of them have Psub6_limit values less than PuE_max if possible.

- Select the RAT/band having the highest measured 1gSAR at Psub6_limit if multiple RATs/bands have the same lowest Psub6 limit.
- Select the RAT/band having the lowest measured 1gSAR at Psub6_limit if multiple RATs/bands have the same highest Psub6_limit.

4.5.2 Procedure

TX power is measured, recorded, and processed by the following steps:

Step 1~4: measure and record TX power versus time for test scenario 4

Step 1

Measure / setting

 Measure P_{sub6_limit} for both the selected RATs and bands. Measure P_{sub6_limit} with TA-SAR enabled and $P_{UE_backoff_offset}$ set to 0 dB, callbox set to request maximum power.

Step 2

- Apply actual (intended) value to $P_{UE_backoff_offset}$ and reset power on EUT to enable TA-SAR.
- Step 3
- Establish radio link in first selected RAT/band with callbox .

Step 4

Initial request

Request EUT's Tx power at 0 dBm for at least one time window specified for the selected RAT/band

Measure and record the conducted Tx power versus time for the full duration of this test

Then request EUT's Tx power to be at maximum power for at least one time window.

RAT/Band switch

- Switch the radio link to second RAT/band selected.
- For the remaining time, continue callbox requesting EUT's Tx power to be at maximum power for at least one time window.

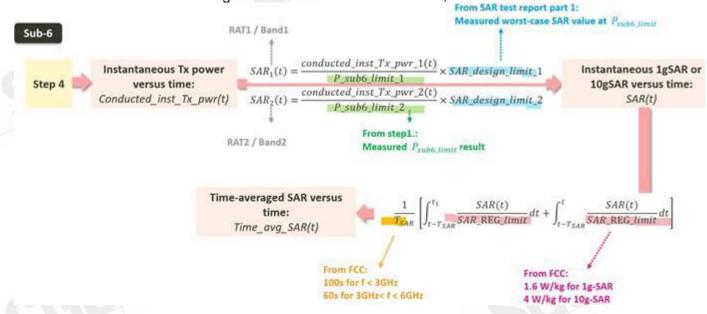

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

Page: 23 of 89

4.6 Test Configuration and Procedure for Scenario 5: Exposure Condition Index (ECI) **Change via Conducted Power Measurements**

4.6.1 Configuration

Select any one RAT/band, which has at least two ECIs whose Psub6_limit values are different and are below PUE max.

4.6.2 Procedure

The test procedure is identical to section 4.5.2 except the following 2 changes:

- 1. Replace band switch operation with ECI switch.
- 2. In Step 4, the second ECI switching is arranged after the first one lasts for at least one time window, i.e., switch the second ECI back to the first ECI, and then continue with callbox requesting EUT's Tx power to be at maximum power for at least one time window.

It is noted that the following operations are done as well for this scenario:

- The correct power control is controlled by TA SAR during ECI switches from one ECI to another.
- The validation criteria are, at all times, the time-averaged 1gSAR or 10gSAR versus time shall not exceed FCC limit of 1.6 W/kg for 1gSAR or 4.0 W/kg for 10gSAR.

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

Page: 24 of 89

4.7 Test Configuration and Procedure for Scenario 6 Antenna Switching via Conducted **Power Measurements**

4.7.1 Configuration

Among RATs/bands supporting TX antenna switches, select the RAT/band with the highest P_{sub6} limit difference between a pair of supported TX antennas.

- Select the RAT/band having the highest measured 1gSAR at Psub6_limit if multiple RATs/bands having the same Psub6_limit difference between the supported TX antennas.
- Antenna selection order o Select the configuration with two antennas having Psub6_limit values less than Pue max.
 - o If the previous configuration does not exist, select the configuration with one antenna having Psub6_limit value less than PUE_max.
 - o If the above two cannot be found, select one configuration with the two antennas having the least difference between their Psub6_limit and PUE_max (i.e., Psub6_limit can be greater than PUE_{max}).

4.7.2 Procedure

The test procedure is identical to section 4.5.2 except the following 2 changes:

- 1. Replace band switch operation with antenna switch.
- 2. In Step 4, the second antenna switching is arranged after the first one lasts for at least one time window, i.e., switch the second antenna back to the first antenna, and then continue with callbox requesting EUT's Tx power to be at maximum power for at least one time window.

It is noted that the following operations are done as well for this scenario:

- The correct power control is controlled by TA_SAR during antenna switches from one antenna to another.
- The validation criteria are, at all times, the time-averaged 1gSAR or 10gSAR versus time shall not exceed FCC limit of 1.6 W/kg for 1gSAR or 4.0 W/kg for 10gSAR.

台灣檢驗科技股份有限公司

Page: 25 of 89

4.8 Test Configuration and Procedure for Scenario 7: Time Window Switching via **Conducted Power Measurements**

4.8.1 Configuration

Select one RAT/band with 60-second time averaging window, and the other RAT/band with 100-second time averaging window. Both of them have Psub6_limit values less than PUE_max if possible.

• At least one of the selected RAT/band has its Psub6_limit less than PUE_max.

4.8.2 Procedure

TX power is measured, recorded, and processed by the following steps:

Step 1~4: measure and record TX power versus time for test scenario 7

Measure / setting Step 1

 Measure P_{sub6 limit} for both the selected RATs and bands. Measure P_{sub6 limit} with TA-SAR enabled and $P_{UE_backoff_offset}$ set to 0 dB, callbox set to request maximum power.

Step 2

- Apply actual (intended) value to PuE backoff offset and enable TA-SAR.
- Transition from 100s time window to 60s time window, and vice versa (step3 to step 6)

Step 3

Establish radio link in the RAT/band having 100s time window selected with callbox.

Measure and record the conducted Tx power versus time for the full duration of this test

Initial request

- Request EUT's Tx power to be at 0 dBm for at least one time window
- Then request EUT's Tx power to be at maximum power for at least one time window (100 seconds)

Step 4

Tech/Band switch

- Switch the radio link to second RAT/band (having 60s time window) selected.
- In this second RAT/band, let callbox request EUT's Tx power to be at maximum power for at least one time window (60 seconds)

Switch back

- Switch the radio link back to the first RAT/band.
- For the remaining time, continue with callbox requesting EUT's Tx power to be at maximum power for at least another time window (100 seconds)

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

 Step 5: convert the measured conducted TX power into SAR Convert the measured conducted TX power from step 4 into 1gSAR or 10gSAR value using the following equation. Perform the running time average to power and 1gSAR or 10g SAR to determine time-averaged value versus time as follows,

- Step 6: plot results
 - A. Make one power perspective plot containing
 - 1. Instantaneous TX power
 - 2. Requested power
 - 3. Calculated time-averaged power
 - 4. Calculated time-averaged power limits
 - B. Make one SAR perspective plot containing
 - Calculated time-averaged 1gSAR or 10gSAR
 - 2. FCC limit of 1.6 W/kg (1gSAR) or 4.0 W/kg (10gSAR)
 - 3. Normalized time-averaged 1gSAR/1.6 or 10gSAR/4.0

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

Page: 27 of 89

 Step 7~8: measure and record TX power versus time in another time window change Transition from 60s time window to 100s time window, and vice versa (step7 to step 9)

Step 7

Establish radio link with callbox in the RAT/band having 60s time window selected.

Measure and record the conducted Tx power versus time for the full duration of this test

Initial request

- Request EUT's Tx power to be at 0 dBm for at least one time window
- Then request EUT's Tx power to be at maximum power for at least one time window (60 seconds)

Tech/Band switch

- Switch the radio link to second RAT/band (having 100s time window) selected.
- In this second RAT/band, let callbox request EUT's Tx power to be at maximum power for at least one time window (100 seconds).

Switch back

- Switch the radio link back to the first RAT/band.
- For the remaining time, continue with callbox requesting EUT's Tx power to be at maximum power for at least another time window (60 seconds)
- Step 9: convert the measurement and plot results Convert the measured conducted TX power from step 8 into 1gSAR or 10gSAR value using the equation in step 5.

Repeat step 6 to generate the plots.

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

4.9 Test Configuration and Procedure for Scenario 8: SAR Exposure Switching via **Conducted Power Measurements**

4.9.1 Configuration

If supported, SAR exposure switch with two active radios having the same and different time averaging windows should be covered in this test. Mediatek's TA algorithm operation is independent of the source of SAR exposure (e.g., LTE vs. NR FR1) and ensures total time-averaged RF exposure compliance for SAR exposure among the scenarios of radio 1 only, radio 1 + radio 2, and radio 2 only.

- Select any two < 6GHz RATs/bands that the EUT supports for simultaneous transmission (e.g., LTE+NR FR1).
- The selection order among all supported simultaneous transmission configurations is o Select one configuration with Psub6 limit values of radio1 and radio2 less than their corresponding *Pue_max*, and their *Psub6_limit* values are different if possible.
 - o If the previous configuration does not exist, at least one radio has its Psub6_limit less
 - o If above two cannot be found, select one configuration that has Psub6_limit of radio1 and radio2 with the least difference between Psub6_limit and PUE_max (i.e., Psub6_limit can be greater than *Pue_max*).
- · One test with two active radios in any two different time windows is sufficient to cover this
- One SAR switching is sufficient because the TA algorithm operation is the same.

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

Page: 29 of 89

4.9.2 Procedure

- Step 1~3: measure and record TX power versus time for test scenario 8
 - A. Measure conducted TX power corresponding to radio1 Psub6 limit
 - Establish device in call with the callbox for radio1 band.
 - Measure conducted TX power corresponding to radio1 *Psub6_limit* with TA_SAR enabled and *PuE_backoff_offset* set to 0 dB, callbox set to request maximum power.
 - B. measure conducted TX power corresponding to radio2 Psub6_limit
 - Repeat above step to measure conducted TX power corresponding to radio2 *Psub6_limit*.
 - If radio2 is dependent on radio1 (for example, non-standalone mode of NR FR1 requiring radio1 LTE as anchor), then establish radio1 + radio2 call with callbox, and request all down bits for radio1 LTE.
 - In this scenario, with callbox requesting maximum power from radio2 NR FR1, measured conducted TX power corresponds to radio2 *Psub6_limit* (as radio1 LTE is at all-down bits)

Step 1

Measure / setting

- Measure conducted Tx power corresponding to P_{sub6,limit} for radio1 and radio2 in selected band
- Test condition to measure conducted P_{sub6 limit} is in step 1.A and 1.B
- Apply actual (intended) value to P_{UE_backoff_offset} with EUT setup for radio1 + radio2 call.
- . (In this description, it is assumed that radio2 has lower priority than radio1)

Step 2

Establish link

Establish device in radio1+radio2 call, and request low power (all-down bits) on radio1

Step 3

Measure and record the conducted Tx power for both radio1 and radio2 for the full duration of this test

Radio 2 predominant

- let callbox request EUT's Tx power to be at 0 dBm in radio2 for at least one time window
- Then let callbox request EUT's Tx power to be at maximum power in radio2 for at least one time window

Radio 1+2

- set callbox to request EUT's Tx power to be at maximum power on radio1, i.e., all-up bits
- · Continue radio1+radio2 call with both radios at maximum power for at least one time window

Radio 1 predominant

- drop (or request all-down bits on) radio2
- Continue radio1 at maximum power for at least one time window.

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

Page: 30 of 89

 Step 4: convert the measured conducted TX power into SAR Convert the measured conducted TX power from step 3 into 1gSAR or 10gSAR value using the following equation. Perform the running time average to power and 1gSAR or 10g SAR to determine time-averaged value versus time as follows,

- Step 5: plot results
 - A. Make one power perspective plot containing
 - 1. Instantaneous TX power
 - 2. Requested power
 - 3. Calculated time-averaged power
 - 4. Calculated time-averaged power limits
 - B. Make one SAR perspective plot containing
 - 1. Calculated time-averaged 1gSAR or 10gSAR
 - 2. FCC limit of 1.6 W/kg (1gSAR) or 4.0 W/kg (10gSAR)
 - Normalized time-averaged 1gSAR/1.6 or 10gSAR/4.0

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

4.10 Test Configuration and Procedure for Scenario 2: Time-Varying TX Power via SAR Measurements

4.10.1 Configuration

Sections 4.2 to 4.9 focus on Mediatek's TA feature compliance validation via conducted TX power measurements. This section further provides a SAR measurement procedure for time-varying TX power scenario described in section 4.3. Hence, this section follows the test configuration of section 4.3, and uses test sequences 1 and 2 defined in section 4.1.

4.10.2 Procedure

SAR is measured and recorded by the following steps:

• Step 1~4: measure and record SAR versus time

Measure

- Perform area scan with TA-SAR enabled and $P_{UE\ backoff\ offset}$ set to 0 dB, and callbox set to request maximum power for all the RATs and selected bands.
- Measure meas_SAR at peak location of the area scan. This meas_SAR value, meas_SAR_P_sub6_tlmit, corresponds to meas_SAR at the measured Psub6_limit

Step 2

Setting

Apply actual (intended) value to P_{UE_backoff_offset} and reset power on EUT to enable TA-SAR

Step 3

Establish link

Establish radio link in selected radio configuration

Step 4

Test sequence

Measure and record meas SAR versus time at peak location of the area scar

- Step 5: convert the measured SAR into time-averaged SAR
 - Convert the instantaneous measured SAR from step 4 into 1gSAR or 10gSAR value. Perform the running time average to 1gSAR or 10g SAR to determine time-averaged value versus time as follows,

Configure callbox to request the EUT's Tx power according to pre-defined test sequence 1

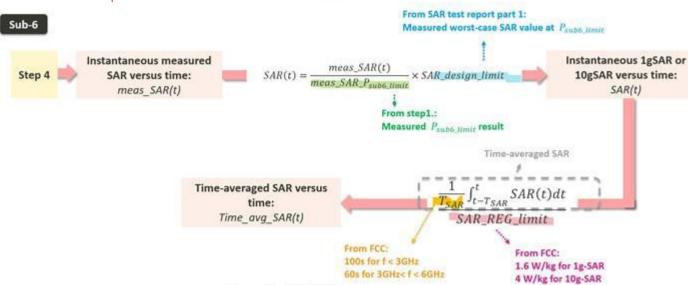

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

Page: 32 of 89

where, meas_SAR_Psub6_limit is the value determined in step 1, and meas_SAR(t) is the instantaneous measured SAR measured in step 4.

- Step 6: plot result
 - A. Calculated time-averaged 1gSAR or 10gSAR
 - B. FCC limit of 1.6 W/kg (1gSAR) or 4.0 W/kg (10gSAR)
- Step 7: repeat steps 2 ~ 6 for pre-defined test sequence 2

Repeat steps 2 ~ 6 for pre-defined test sequence 2 and replace test sequence 1 in step 4 with test sequence 2.

Step 8: repeat steps 2 ~ 7 for all the selected bands

The time-averaged SAR versus time shall not exceed FCC limit at all times.

The call boxes KeySight UXM (supporting sub6 NR and LTE) and Rohde & Schwarz CMW500 (supporting LTE, WCDMA, C2K and 2G) are used to validate the proposed TA-SAR mechanism. Figure 5-2 shows the block diagram of the measurement bench, which supports the following test scenarios.

- Test scenario 1: range of TA-SAR parameters
- Test scenario 2: time-varying TX power
- Test scenario 3: call disconnection and re-establishment
- Test scenario 5: ECI change

For these measurements, RF port of the call box is connected to the EUT's antenna port, and the call box establishes a connection link through the test script console tool and the power meter measures the conducted output power of the EUT. The pictures of Figure 5-2 are relegated in Figures A-1 and A-2 in Appendix A.

Figure 5-3 shows the block diagram of the measurement bench, which support test scenario 4 (band handover) and scenario 7 (time window switching). For these measurements, the RF port of the call box is connected with a 1-to-2 power divider, which allows the call box to transmit/receive signals from the two different system configurations set in these two test scenarios. Figure 5-4 shows the setup, which is highly similar to Figure 5-3, to support test scenario 6 (antenna switching); as seen in the figure, two EUT's antenna ports are individually connected with a RF cable. The pictures for these two setups are shown in Figures A-3 and A-4 in Appendix A.

Figure 5-5 shows the setup for test scenario 4 (RAT handover) and scenario 8 (SAR exposure switching). Since two RATs need to be controlled in these two scenarios, RF port of RAT #1 and RF port of RAT #2 of the call box are individually connected to an antenna port of the EUT through a directional coupler. It is noted that each of the two RATs individually transmit signals though one antenna port. The antenna port assignment of each RAT for these two scenarios is described in Figure 5-1. The pictures of Figure 5-5 are shown in Figures A-5 and A-6 in Appendix A.

5.1.2 sub6 NR/LTE/3G/2G Power Limit Table and Test Configurations

For the supported bands/channels/antennas of each technology, the measured power limit (Psub6_limit), corresponding to SAR design limit, is listed in the table 5-1. The SAR_design_limit is determined by taking 1-dB device uncertainty into consideration. Please note that for TDD bands with TX duty cycles less than or equal to 100%, the measured power limit corresponds to the burst averaged power level which does not account for TX duty cycle.

Table 5-1 Summary table of power limit (Psub6 limit) for all supported RAT

			-	lary table	or powe		dBm) Setting	i dii Supp	ortea ItA	•

5.2 Conducted Power Measurement Results for Scenario1: Range of TA-SAR **Parameters**

In this scenario, one TA-SAR parameters are swept to validate Mediatek's TA-SAR algorithm. The parameter sets are summarized in Table 5-3, and the test procedure follows section 4.2.2. The measurement setup is shown in Figure 5-2. The high-level summary of the final validation results are also listed in the last column of the table, which concludes that Mediatek's TA-SAR algorithm can maintain the time-averaged SAR is always below the FCC requirement for all test cases. The following section will demonstrate case-by-case to show how Mediatek's TA-SAR algorithm behaves for different parameters.

Table 5-3 TA-SAR parameters setting for scenario 1

Test case	RAT	Test band	Test seq.	ECI	Max power (dBm)	Psub6_limit (dBm)	PLowThresh (dBm)	Pue_backoff (dBm)	PUE_max _cust (dBm)	Pass /Fail SAR limit
0	LTE	B30	0	4	21.8	16.5	16	13.5	19.5	Pass

The corresponding detailed test procedure is described in 4.2.2. For the figure set of each case, the first figure demonstrates the EUT's instantaneous conducted TX power, the time-averaged conducted TX power behavior over time, and the power limit $(P_{reg_sub6_limit} = P_{sub6_limit} + 1dB device uncertainty)$. The second figure illustrates the corresponding time-averaged SAR over time converted from the TX time-averaged power by using the equation listed in section 4.2.2. For all test cases, the time-averaged SAR does not exceed the FCC limit.

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

5.3 Conducted Power Measurement Results for Scenario 2: Time-Varying TX Power

In this scenario, Mediatek's TA-SAR algorithm is tested under more dynamic power test sequences. The test sequence #1 is shown in section 4.1 and test sequence #2 is tabulated in table 4.4. All of the test cases for this scenario are relegated in Table 5-4, and the test procedure follows section 4.3.2. The measurement setup is shown in Figure 5-2. The high-level summary of the final validation results are also listed in the last column of the table, which concludes that Mediatek's TA-SAR algorithm can maintain the time-averaged SAR is always below the FCC requirement for all test cases. The following sections will demonstrate case-by-case to show how Mediatek's TA-SAR algorithm behaves for each RAT.

5.3.1 Measurement results for NR

The corresponding detailed test procedure is described in 4.3.2. For the figure set of each case, the first figure demonstrates the EUT's instantaneous conducted TX power, the time-averaged conducted TX power behavior over time, and the power limit (P_reg_sub6_limit = Psub6_limit + 1dB device uncertainty). The second figure illustrates the corresponding time-averaged SAR over time converted from the TX time-averaged power by using the equation listed in section 4.3.2. For all test cases, the time-averaged SAR does not exceed the FCC limit.

5.3.2 Measurement results for LTE

The corresponding detailed test procedure is described in 4.3.2. For the figure set of each case, the first figure demonstrates the EUT's instantaneous conducted TX power, the time-averaged conducted TX power behavior over time, and the power limit (P_reg_sub6_limit = P_{sub6_limit} + 1dB device uncertainty). The second figure illustrates the corresponding time-averaged SAR over time converted from the TX time-averaged power by using the equation listed in section 4.3.2. For all test cases, the time-averaged SAR does not exceed the FCC limit.

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

5.4 Conducted Power Measurement Results for Scenario 3: Call Disconnection and Re-establishment

In this scenario, the test power sequence #0 (i.e., maximum TX power is requested by a call box for each RAT) is used, and the call drop is manually configured for a pre-defined period and then the call is re-established to continue data transmission. The test case for this scenario is relegated in Table 5-5, and the test procedure follows section 4.4.2. The measurement setup is shown in Figure 5-2. The high-level summary of the final validation results is also listed in the last column of the table, which concludes that Mediatek's TA-SAR algorithm can maintain the time-averaged SAR is always below the FCC requirement. The following section will demonstrate how Mediatek's TA-SAR algorithm behaves.

Table 5-5 TA-SAR parameters setting for scenario 3

Test case	RAT	Test band	Test seq.	ECI	Max power (dBm)	Psub6_limit (dBm)	PLowThresh (dBm)	PUE_backoff (dBm)	PUE_max _cust (dBm)	Pass /Fail SAR limit
9	LTE	Band 30	1	4	21.8	16.5	16	13.5	19.5	Pass

The corresponding detailed test procedure is described in 4.4.2. Figure 5-42 demonstrates the EUT's instantaneous conducted TX power, the time-averaged conducted TX power behavior over time, and the power limit (P reg sub6 limit = P_{sub6_limit} + 1dB device uncertainty). Figure 5-43 illustrates the corresponding time-averaged SAR over time converted from the TX time-averaged power by using the equation listed in section 4.4.2. As seen in this figure, the time-averaged SAR does not exceed the FCC limit.

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

5.5 Conducted Power Measurement Results for Scenario 4: Band Handover

In this scenario, the test power sequence #0 (i.e., maximum TX power is requested by a call box for each RAT) is used, and band (and RAT) handover is manually configured at a specific time instance. The test case widely cover handover scenarios between two RATs. The test case for this scenario is relegated in Table 5-6, and the test procedure follows section 4.5.2. The measurement setup is shown in Figure 5-3 (band handover) and Figure 5-5 (RAT handover). The high-level summary of the final validation results is also listed in the last column of the table, which concludes that Mediatek's TA-SAR algorithm can maintain the time-averaged SAR is always below the FCC requirement. The following section will demonstrate how Mediatek's TA-SAR algorithm behaves.

Table 5-6 TA-SAR parameters setting for scenario 4

Test case	RAT	Test band	Test seq.	ECI	Max power (dBm)	Psub6_limit (dBm)	PLowThresh (dBm)	PUE_backoff (dBm)	PUE_max _cust (dBm)	Pass /Fail SAR limit
10	LTE	Band 30	0	4	21.8	16.5	16	13.5	19.5	Pass
10	FR1	n48	0	4	22.7	19.47	18.97	16.47	22.47	Pass

The corresponding detailed test procedure is described in 4.5.2. The first figure demonstrates the EUT's instantaneous conducted TX power and the time-averaged conducted TX power behavior over time, and the power limit ($P_{reg_sub6_limit} = P_{sub6_limit} + 1dB$ device uncertainty). The handover is configured at the time instance of 500 seconds. It is observed in the figure that the time-averaged TX power of the individual RAT is below its own Psub6_limit. The second figure illustrates the corresponding time-averaged normalized SAR over time converted from the TX time-averaged power by using the equation listed in section 4.5.2. The figure shows that the time-averaged normalized SAR does not exceed the normalized FCC limit of 1.

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

5.6 Conducted Power Measurement Results for Scenario 5: ECI Change

In this scenario, the test power sequence #0 (i.e., maximum TX power is requested by a call box for each RAT) is used, and ECI change at the EUT side is manually configured at a specific time instance. The test case cover ECI switching scenario between two ECIs. The test case for this scenario is relegated in Table 5-7, and the test procedure follows section 4.6.2. The measurement setup is shown in Figure 5-2. The high-level summary of the final validation results is also listed in the last column of the table, which concludes that Mediatek's TA-SAR algorithm can maintain the time-averaged SAR is always below the FCC requirement. The following section will demonstrate how Mediatek's TA-SAR algorithm behaves.

Table 5-7 TA-SAR parameters setting for scenario 5

-											
	Test case	RAT	Test band	Test seq.	ECI	Max power (dBm)	Psub6_limit (dBm)	PLowThresh (dBm)	PUE_backoff (dBm)	PUE_max _cust (dBm)	Pass /Fail SAR limit
	11	LTE	Band 30	0	4	21.8	16.5	16	13.5	19.5	Pass
	11	LTE	Band 30	0	3	21.8	17.7	17.2	14.7	20.7	Pass

The corresponding detailed test procedure is described in 4.6.2. The first figure demonstrates the EUT's instantaneous conducted TX power and the time-averaged conducted TX power behavior over time, and the power limit (P reg sub6 limit = P_{sub6_limit} + 1dB device uncertainty). During the test period, there are two ECI change events configured individually at the time instances 500 seconds and 700 seconds. The 1st change is from ECI = 4 to ECI = 3 and the 2nd change is from ECI = 3 back to ECI = 4. It is observed in the figure that the time-averaged TX power of the individual RAT is below its own Psub6_limit. The second figure illustrates the corresponding time-averaged normalized SAR over time converted from the TX time-averaged power by using the equation listed in section 4.6.2. The figure shows that the time-averaged normalized SAR does not exceed the normalized FCC limit of 1.

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

Page: 58 of 89

•Case 11 in table 5-7: two ECI changes happen at the time instances of 500 and 700 seconds, respectively.

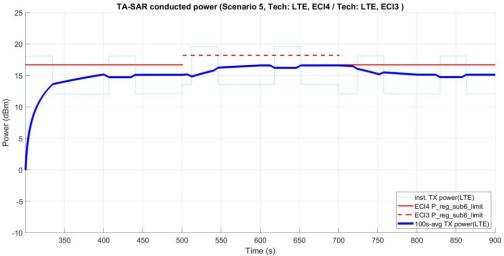

Figure 5- 28 Time-averaged conducted TX power over time for case 11 (LTE Band 30) NOTE: The inst. TX power should be compared with P_reg_sub6_limit of the corresponding configuration, then transformed and averaged in SAR perspective to check compliance. Therefore, even though the time-averaged TX power seems to exceed P_reg_sub6_limit after configuration changed (from 700s to 730s), the time-averaged SAR pass regulation as a matter of fact.

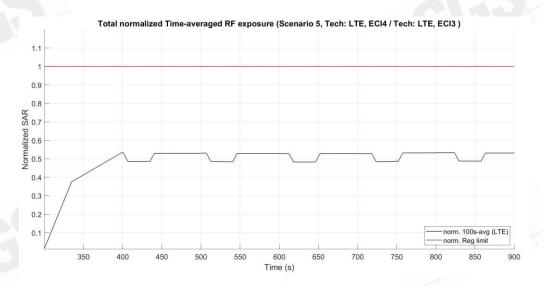

Figure 5- 29 Normalized time-averaged SAR for case 11 (LTE Band 30)

FCC limit of total RF exposure (normalized)	1.0
Max total normalized time-averaged RF exposure	0.536
Validation result: pass

5.7 Conducted Power Measurement Results for Scenario 6: Antenna Switching

In this scenario, the test power sequence #0 (i.e., maximum TX power is requested by a call box for each RAT) is used, and antenna change at the EUT side is manually configured at a specific time instance. The test case for this scenario is relegated in Table 5-8, and the test procedure follows section 4.7.2. The measurement setup is shown in Figure 5-4. The high-level summary of the final validation results is also listed in the last column of the table, which concludes that Mediatek's TA-SAR algorithm can maintain the time-averaged SAR is always below the FCC requirement. The following sections will demonstrate how Mediatek's TA-SAR algorithm behaves.

Table 5-8 TA-SAR parameters setting for scenario 6

_											
	Test case	RAT	Test band	Test seq.	ECI	Max power (dBm)	Psub6_limit (dBm)	P _{LowThresh} (dBm)	PuE_backoff (dBm)	PUE_max _cust (dBm)	Pass /Fail SAR limit
	10	LTE	Band 2	0	4	23.3	20.0	19.6	17.1	23.1	Pass
	12	LTE	Band 2	0	4	23.3	31.4	30.9	28.4	23.3	Pass

The corresponding detailed test procedure is described in 4.7.2. The first figure demonstrates the EUT's instantaneous conducted TX power and the time-averaged conducted TX power behavior over time, and the power limit ($P_{reg_sub6_limit} = P_{sub6_limit} + 1dB$ device uncertainty). During the test period, there are two antenna change events configured individually at the time instances 500 seconds and 700 seconds. It is observed in the figure that the time-averaged TX power during the transition of the change is maintained below the power limitation. The second figure illustrates the corresponding time-averaged normalized SAR over time converted from the TX time-averaged power by using the equation listed in section 4.7.2. The figure shows that the time-averaged normalized SAR does not exceed the normalized FCC limit of 1.

5.8 Conducted Power Measurement Results for Scenario 7: Time Window Switching

In this scenario, the test power sequence #0 (i.e., maximum TX power is requested by a call box for each RAT) is used, and band handover events within a RAT are manually configured at specific time instances. This scenario aims to validate the correctness of the TA-SAR algorithm with existence of moving average time window change. The two test cases for this scenario are relegated in Table 5-9, and the test procedure follows section 4.8.2. The measurement setup is shown in Figure 5-3. The high-level summary of the final validation results are also listed in the last column of the table, which concludes that Mediatek's TA-SAR algorithm can maintain the time-averaged SAR is always below the FCC requirement for all the cases. The following sections will demonstrate how Mediatek's TA-SAR algorithm behaves.

Table 5-9 TA-SAR parameters setting for scenario 7

Test case	RAT	Test band	Test seq.	ECI	Max power (dBm)	Psub6_limit (dBm)	PLowThresh (dBm)	PUE_backoff (dBm)	PUE_max _cust (dBm)	Pass /Fail SAR limit
40	LTE	Band 30	0	4	21.8	16.5	16	13.5	19.5	Pass
13	LTE	Band 48	0	4	22.79	21.99	21.49	18.99	22.79	Pass

5.9 Conducted Power Measurement Results for Scenario 8: SAR Exposure Switching

In this scenario, the test power sequence #0 (i.e., maximum TX power is requested by a call box for each RAT) is used, and LTE and sub6 NR are turned on at the same time for a pre-defined period during the test. This scenario aims to validate whether the TA-SAR algorithm is able to maintain TER below the FCC limit when the two radios change TX power dynamically. The experiment parameters are summarized in Table 5-10, and the test procedure follows section 4.9.2. The measurement setup is shown in Figure 5-5.

Table 5-10 TA-SAR parameters setting for scenario 8

Test case	RAT	Test band	Test seq.	ECI	Max power (dBm)	Psub6_limit (dBm)	PLowThresh (dBm)	Pue_backoff (dBm)	PUE_max _cust (dBm)	Pass /Fail SAR limit
15	LTE	Band 2	0	4	23.3	31.4	30.9	28.4	23.3	Pass
15	FR1	n77_PC3	0	4	22.77	16.97	16.47	13.97	22.01	Pass
40	LTE	Band 2	0	4	23.3	20.0	19.6	17.1	23.1	Pass
16	LTE	Band 14	0	4	23.8	31.3	30.8	28.3	23.8	Pass

During the test period,

Time = 300s~500s: NR sub5-only scenario.

Time = 500s~700s: LTE+ NR sub6 scenario.

• Time = 700s~900s: LTE-only scenario.

The first figure demonstrates the EUT's instantaneous conducted TX power and the time-averaged conducted TX power behavior over time, and the power limit (P reg sub6 limit = P_{sub6_limit} + 1dB device uncertainty). It is observed in the figure that the time-averaged TX power in all time periods is maintained below the power limitation. The second figure illustrates the corresponding time-averaged normalized SAR over time converted from the TX time-averaged power by using the equation listed in section 4.9.2. The figure shows that the time-averaged normalized SAR does not exceed the normalized FCC limit of 1.

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。

6. TA-SAR Validation via SAR Measurements

6.1 Measurement Setup

The measurement setup is similar to normal fixed power SAR measurement. The difference in SAR measurement setup for time averaging feature validation is that the call box operates under the close loop power control mode and is connected to the PC, so that the PC can control the call box based on the test sequence to configure EUT's TX target power. The same test procedure used in conducted power setup for time-varying TX power measurement is also used in this section for time-averaging SAR measurements. Since the SAR chamber is an uncontrolled environment, the path loss between call box antenna and the EUT are well calibrated. The test setup is illustrated in Figure 6-1, and its photos are shown in Figure 6-2.

6.2 SAR Measurement Results for Scenario 2: Time-Varying TX Power

In this scenario, Mediatek's TA-SAR algorithm is tested under more dynamic power test sequences. The test sequence #1 is shown in section 4.1 and test sequence #2 is tabulated in table 4.4. All of the test cases for this scenario are relegated in Table 6-1, and the test procedure follows section 4.10.2. The measurement setup is shown in Figure 6-1, 6-2(a) and 6-2(b). The high-level summary of the final validation results is given in the last column of the table, which concludes that Mediatek's TA-SAR algorithm can maintain the time-averaged SAR is always below the FCC requirement for all test cases. The following sections will demonstrate case-by-case to show how Mediatek's TA-SAR algorithm behaves for each RAT.

Table 6-1 Operating parameters for different TA-SAR parameters setting

Table 0-1 Operating parameters for different TA-SAN parameters setting										
Test case	RAT	Test band	Test seq.	ECI	Max power (dBm)	Psub6_limit (dBm)	$P_{LowThresh}$ (dBm)	PUE_backoff (dBm)	PUE_max _cust (dBm)	Pass /Fail SAR limit
1	LTE	Band 30	1	4	21.8	16.5	16	13.5	19.5	Pass

7. Conclusions

This document proposes TA-SAR test scenarios and procedures, and further proves Mediatek's TA-SAR algorithms can meet the FCC SAR regulations with the proposed test scenarios and procedures. As shown in Chapters, Mediatek's TA-SAR algorithms are able to maintain SAR over time below the FCC regulatory limits. Furthermore, the near-field measurements are also done to further validate the proposed test methodologies, and the results shown in Chapters to demonstrate that Mediatek's TA-SAR algorithms really can maintain SAR and PD over time below the FCC regulatory limits under the proposed test procedures. Based on the provided measurement evidences, it is concluded that Mediatek's TA-SAR algorithms can be tested by using the proposed test methodology for FCC compliance.

Appendix A. cDASY6 System Verification

FX3DV4 F-Field Probe

EX3DV4 E-FI	eid Probe			
Construction	Symmetrical design with triangular core			
	Built-in shielding against static charges			
	PEEK enclosure material (resistant to			
	organic solvents, e.g., DGBE)			
Calibration	Basic Broad Band Calibration in air Conversion Factors (CF) for HSL 1750/2300MHz Additional CF for other liquids and frequencies upon request			
Frequency	10 MHz to > 6 GHz			
Directivity	± 0.3 dB in HSL (rotation around probe axis)			
	± 0.5 dB in tissue material (rotation normal to probe axis)			
Dynamic	10 μ W/g to > 100 mW/g			
Range	Linearity: ± 0.2 dB (noise: typically < 1 µW/g)			
Dimensions	Tip diameter: 2.5 mm			
Application	High precision dosimetric measurements in any exposure scenario			
	(e.g., very strong gradient fields). Only probe which enables			
	compliance testing for frequencies up to 6 GHz with precision of			
	better 30%.			

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only. 除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留'0天。本報告未經本公司書面許可,不可部份複製。

Phantom

Phantom								
Model	Twin SAM							
Construction	The shell corresponds to the specifications of the Specific							
	Anthropomorphic Mannequin (SAM) phantom defined in IEEE 15							
	and IEC 62209.							
	It enables the dosimetric evaluation of left and right hand phone							
	usage as well as body mounted usage at the flat phantom region. A							
	cover prevents evaporation of the liquid. Reference markings on							
	the phantom allow the complete setup of all predefined phantom							
	positions and measurement grids by manually teaching three							
	points with the robot.							
Shell Thickness	2 ± 0.2 mm							
Filling Volume	Approx. 25 liters							
Dimensions	Height: 850 mm;							
	Length: 1000 mm;							
	Width: 500 mm							

DEVICE HOLDER

Construction	In combination with the Twin SAM Phantom						
	V4.0/V4.0C or Twin SAM, the Mounting						
	Device (made from POM) enables the						
	rotation of the mounted transmitter in						
	spherical coordinates, whereby the rotation						
	point is the ear opening. The devices can						
	be easily and accurately positioned						
	according to IEC, IEEE, CENELEC, FCC or						
	other specifications. The device holder can						
	pe locked at different phantom locations						
	(left head, right head, flat phantom).

Appendix C Tissue and System Verification

Tissue Verification

The following tissue formulations are provided for reference only as some of the parameters have not been thoroughly verified. The composition of ingredients may be modified accordingly to achieve the desired target tissue parameters required for routine SAR evaluation.

The composition of the brain tissue simulating liquid is:

Simulating Liquids for 600 MHz -10 GHz, Manufactured by SPEAG:

	9 E194146 101 000 1111 1E	ro oriz, manarataroa zy or zy		
Broad-band head	SPEAG Product	Frequency range (MHz)	Main Ingredients	
tissue simulating	HBBL600-10000V6	600 - 10000	Water, Oil	
liquids	110000-1000000	000 - 10000	Water, Oil	

Tissue Simulant Fluid for the Frequency Band

The dielectric properties for this Head-simulant fluid were measured by using the SPEAG Dielectric Assessment Kit (DAKS-3.5)

All dielectric parameters of tissue simulates were measured within 24 hours of SAR measurements. The measured conductivity and permittivity are all within ± 5% of the target values.

The depth of the tissue simulant in the flat section of the phantom was ≥ 15 cm ± 5 mm during all tests. (Fig. 2)

Measured Frequency (MHz)	I Dielectric	Target Conductivity, σ (S/m)	Measured Dielectric Constant, εr	Measured Conductivity, σ (S/m)	% dev εr	% dev σ	Limit	Measurement Date	Liquid Temp. (°C)	Ambient Temp (°C)
1732.5	40.096	1.361	39.552	1.333	-1.36%	-2.09%	± 5%	Oct. 11, 2023	22.2	21.7

System Verification

The microwave circuit arrangement for system verification is sketched in Fig. b. The daily system accuracy verification occurs within the flat section of the SAM phantom. A SAR measurement was performed to see if the measured SAR was within +/- 10% from the target SAR values. These tests were done at 1900/2600MHz. The tests were conducted on the same days as the measurement of the DUT. The obtained results from the system accuracy verification are displayed in the table 1 (SAR values are normalized to 1W forward power delivered to the dipole). During the tests, the liquid depth above the ear reference points was above 15 cm in all the cases. It is seen that the system is operating within its specification, as the results are within acceptable tolerance of the reference values.

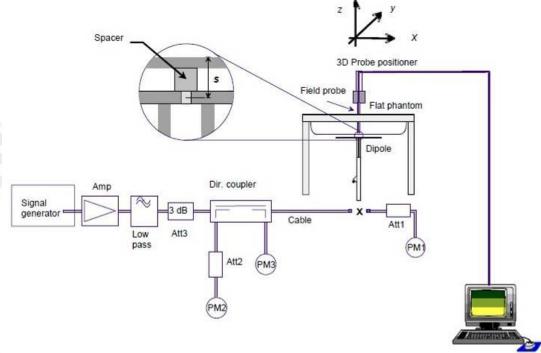

Fig. b The block diagram of system verification

8. SAR SYSTEM CHECK RESULTS

Date: 2023/10/11

Report No.: TESA2308000495ES **Dipole 1750 MHz SN:1158**

Communication System: CW; Frequency: 1750 MHz; Duty cycle= 1:1

Medium parameters used: f = 1750 MHz; $\sigma = 1.342 \text{ S/m}$; $\epsilon_r = 39.507$; $\rho = 1000 \text{ kg/m}^3$

Phantom section: Flat Section

Ambient temperature: 21.7°C; Liquid temperature: 22.2°C

DASY5 Configuration:

Probe: EX3DV4 - SN7712; ConvF(8.77, 8.77, 8.77); Calibrated: 2023/04/14

Sensor-Surface: 2mm (Mechanical Surface Detection)

Electronics: DAE4 Sn856; Calibrated: 2023/04/26

Phantom: SAM

DASY52 52.10.4(1527); SEMCAD X 14.6.14(7483)

Area Scan (51x101x1): Interpolated grid: dx=15 mm, dy=15 mm

Maximum value of SAR (interpolated) = 12.4 W/kg

Zoom Scan (7x7x7)/Cube 0: Measurement grid: dx=5mm, dy=5mm, dz=5mm

Reference Value = 94.92 V/m: Power Drift = -0.01 dB

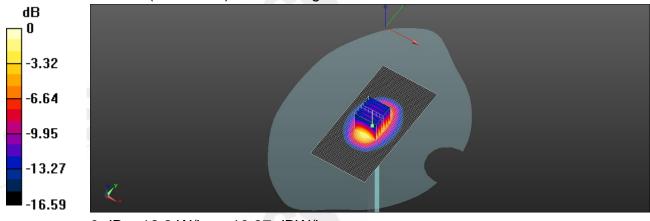

Peak SAR (extrapolated) = 15.4 W/kg

SAR(1 g) = 8.67 W/kg; SAR(10 g) = 4.64 W/kg

Smallest distance from peaks to all points 3 dB below = 11 mm

Ratio of SAR at M2 to SAR at M1 = 56.7%

Maximum value of SAR (measured) = 12.2 W/kg

0 dB = 12.2 W/kg = 10.87 dBW/kg

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only.

除非另有說明,此報告結果僅對測試之樣品負責,同時此樣品僅保留90天。本報告未經本公司書面許可,不可部份複製。
