Statement of Compliance

Manufacturer: Voyetra Turtle Beach, Inc.

100 Summit Lake Drive, Suite 100 Valhalla, New York, 10595 USA

Requester / Applicant: Tim Blaney

Name of Equipment: Wireless Audio Headset

Model No. Elite 800X RX (TB300-2390-01)

Type of Equipment: Intentional Radiator

Application of Regulations: CFR 47 Part 15.247:2014 and RSS-210:2010

Test Dates: 26 February 2015 to 22 March 2015

Guidance Documents:

Emissions: ANSI C63.10-2009, KDB 558074 D01 DTS Measurement Guidance v03r01

Test Methods:

Emissions: ANSI C63.10-2009, KDB 558074 D01 DTS Measurement Guidance v03r01

The electromagnetic compatibility test and documented data described in this report has been performed and recorded by TUV Rheinland, in accordance with the standards and procedures listed herein. As the responsible authorized agent of the EMC laboratory, I hereby declare that the equipment described above has been shown to be compliant with the EMC requirements of the stated regulations and standards based on these results. If any special accessories and/or modifications were required for compliance, they are listed in the Executive Summary of this report.

This report must not be used to claim product endorsement by A2LA or any agency of the U.S. Government. This report contains data that are not covered by A2LA accreditation. This report shall not be reproduced except in full, without the written authorization of TUV Rheinland of North America.

1 Executive Summary

1.1 Scope

This report is intended to document the status of conformance with the requirements of the CFR 47 Part 15.247:2014 and RSS-210:2010 based on the results of testing performed on 26 February 2015 to 22 March 2015 on the Wireless Audio Headset Model Elite 800X RX manufactured by Voyetra Turtle Beach, Inc. This report only applies to the specific samples tested under the stated test conditions. It is the responsibility of the manufacturer to assure that additional production units of this model are manufactured with identical or EMI equivalent electrical and mechanical components. This report is further intended to document changes and modifications to the EUT throughout its life cycle. All documentation will be included as a supplement.

1.2 Purpose

Testing was performed to evaluate the EMC performance of the EUT in accordance with the applicable requirements, procedures, and criteria defined in the application of regulations and application of standards listed in this report.

The report documents the 2.4GHz radio characteristics for the Elite 800X RX.

Report Number: 31560640.001 EUT: Wireless Audio Headset, Model: Elite 800X RX

Report Date: April 2, 2015

1.3 Summary of Test Results

Table 1: Summary of Test Results

Test Method ANSI C63.4:2003/ ANSI C63.		Test Parameters	Measured Value	Result
	2402 MHz to 2480 M	IHz Band		
Spurious Emission in Transmitted Mode	CFR47 15.209, RSS-GEN Sect.7.2.3	Class B	-2.07 dB (Margin)	Complied
Restricted Bands of Operation	CFR47 15.205, RSS 210 Sect.2.6	Class B	-2.07 db (Margin)	Complied
AC Power Conducted Emission	CFR47 15.207, RSS-GEN Sect.7.2.2	N/A	Na.	N/A
Occupied Bandwidth	CFR 47 15.247(a1), RSS Gen Sect. 4.4.1	N/A	20dB BW = 774 kHz 99% BW = 838 kHz	Complied
Channel Separation	CFR47 15.247 (a1), RSS 210 Sect. A.8.1	> 828 kHz	1012 kHz	Complied
Number of Hopping Channels	CFR47 15.247 (a1), RSS 210 Sect. A.8.1	>15	79 Channels	Complied
Average time occupancy of Channel	CFR47 15.247 (a1), RSS 210 Sect. A.8.1	< 0.4 sec	320.76 mS	Complied
Maximum Transmitted Power	CFR47 15.247 (b1), RSS 210 Sect. A.8.1	< 1Watt	2.84 mW	Complied
Out of Band Emission	CFR47 15.247 (d), RSS 210 Sect. A.8.5	< -20 dBr	- 17.95 dBr (-47.74 dBm at 4960 MHz)	Complied
Maximum Permissible Exposure	CFR47 15.247 (i), 2.1093 / KDB 447498 D01	≤ 3.0 for 1-g	0.427 for 1-g (SAR Exempted)	Complied

Note: 1. Meet restricted band emission requirements.

1.4 Special Accessories

No special accessories were necessary in order to achieve compliance.

1.5 Equipment Modifications

None

^{2.} This report is only documented for 2402 – 2480MHz.

Laboratory Information

2.1 Accreditations & Endorsements

2.1.1 US Federal Communications Commission

TUV Rheinland of North America at 1279 Quarry Ln, Pleasanton, CA 94566 is recognized by the commission for performing testing services for the general public on a fee basis. These laboratory test facilities have been fully described in reports submitted to and

accepted by the FCC (US5254). The laboratory scope of accreditation includes: Title 47 CFR Parts 15, 18, and 90. The accreditation is updated every 3 years.

2.1.2 NIST / A2LA

TUV Rheinland of North America is accredited by the National Voluntary Laboratory Accreditation Program, which is administered under the auspices of the National Institute of Standards and Technology. The laboratory has been assessed and accredited in accordance with ISO Guide 17025:2005 and ISO 9002 (Lab Code 3331.02). The scope of laboratory accreditation includes

emission and immunity testing. The accreditation is updated annually.

Canada - Industry Canada 2.1.3

TUV Rheinland of North America at the 1279 Quarry Ln, Pleasanton, CA 94566 address is accredited by Industry Canada for performing testing services for the general public on a fee basis. This laboratory test facilities have been

fully described in reports submitted to and accepted by Industry Canada (File Number 2932M). This reference number is the indication to the Industry Canada Certification Officers that the site meets the requirements of RSS 212, Issue 1 (Provisional). The accreditation is updated every 3 years.

Japan – VCCI 2.1.4

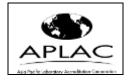

The Voluntary Control Council for Interference by Information Technology Equipment (VCCI) is a group that consists of Information Technology Equipment (ITE) manufacturers and EMC test laboratories. The purpose of the Council is to take voluntary control measures against electromagnetic interference from Information Technology Equipment,

and thereby contribute to the development of a socially beneficial and responsible state of affairs in the realm of Information Technology Equipment in Japan. TUV Rheinland of North America at 1279 Quarry Ln, Pleasanton, CA 94566 has been assessed and approved in accordance with the Regulations for Voluntary Control Measures.

VCCI Registration No. for Pleasanton: A-0031 VCCI Registration No. for Santa Clara: A-0032

2.1.5 Acceptance by Mutual Recognition Arrangement

The United States has an established agreement with specific countries under the Asia Pacific Laboratory Accreditation Corporation (APLAC) Mutual Recognition Arrangement. Under this agreement, all TUV Rheinland at 1279 Quarry Ln, Pleasanton, CA 94566 test results and test reports within the scope of the laboratory NIST / A2LA accreditation will be accepted by each member country.

Report Number: 31560640.001 EUT: Wireless Audio Headset, Model: Elite 800X RX

Report Date: April 2, 2015

2.2 Test Facilities

All of the test facilities are located at 1279 Quarry Lane, Pleasanton, California 94566, USA. The 2305 Mission College, Santa Clara, 95054, USA location is considered a Pleasanton annex.

2.2.1 Emission Test Facility

The Semi-Anechoic chamber and AC Line Conducted measurement facility used to collect the radiated and conducted data has been constructed in accordance with ANSI C63.7:1992. The site has been measured in accordance with and verified to comply with the theoretical normalized site attenuation requirements of ANSI C63.4-2009, at a test distance of 3 and 5 meters. The site is listed with the FCC and accredited by A2LA (Lab Code 3331.02). The 3/5-meter semi-anechoic chamber used to collect the radiated data has been verified to comply with the theoretical normalized site attenuation requirements of ANSI C63.4-2009, at a test distance of 3 meters. A report detailing this site can be obtained from TUV Rheinland of North America.

2.2.2 Immunity Test Facility

ESD, EFT, Surge, PQF: These tests are performed in an environmentally controlled room with a 3.7 m x 4.8 m x 3.175 mm thick aluminum floor connected to PE ground.

For ESD testing, tabletop equipment is placed on an insulated mat with a surface resistivity of 10^9 Ohms/square on a 1.6 m x 0.8 m x 0.8 m high non-conductive table with a 3.175 mm aluminum top (Horizontal Coupling Plane). The HCP is connected to the main ground plane via a low impedance ground strap through two $470\text{-k}\Omega$ resistors. The Vertical Coupling Plane consists of an aluminum plate 50~cm x 50~cm x 3.175~mm thick. The VCP is connected to the main ground plane via a low impedance ground strap through two $470\text{-k}\Omega$ resistors.

For EFT, Surge, PQF, the HCP and VCP are removed.

RF Field Immunity testing is performed in a 7.3m x 4.3m x 4.1m anechoic chamber.

RF Conducted and Magnetic Field Immunity testing is performed on a 4.8m x 3.7m x 3.175mm thick aluminum ground plane.

All test areas allow a minimum distance of 1 meter from the EUT to walls or conducting objects.

Report Number: 31560640.001 EUT: Wireless Audio Headset, Model: Elite 800X RX

Report Date: April 2, 2015

2.3 Measurement Uncertainty

Two types of measurement uncertainty are expressed in this report, per *ISO Guide To The Expression Of Uncertainty In Measurement*, 1st Edition, 1995.

The Combined Standard Uncertainty is the standard uncertainty of the result of a measurement when that result is obtained from the values of a number of other quantities; it is equal to the positive square root of the sum of the variances or co-variances of these other quantities, weighted according to how the measurement result varies with changes in these quantities. The term *standard uncertainty* is the result of a measurement expressed as a standard deviation.

2.3.1 Sample Calculation – radiated & conducted emissions

The field strength is calculated by subtracting the Amplifier Gain and adding the Cable Loss and Antenna Correction Factor to the measured reading. The basic equation is as follows:

Field Strength
$$(dB\mu V/m) = RAW - AMP + CBL + ACF$$

Where: $RAW = Measured level before correction (dB<math>\mu$ V)

$$AMP = Amplifier Gain (dB)$$

$$CBL = Cable Loss (dB)$$

ACF = Antenna Correction Factor (dB/m)

$$\mu V/m = 10^{\frac{\textit{dB}\mu V \, / \, \textit{m}}{20}}$$

Sample radiated emissions calculation @ 30 MHz

Measurement +Antenna Factor-Amplifier Gain+Cable loss=Radiated Emissions (dBuV/m)

$$25 dBuV/m + 17.5 dB - 20 dB + 1.0 dB = 23.5 dBuV/m$$

2.3.2 Measurement Uncertainty Emissions

Per CISPR 16-4-2	$ m U_{lab}$	$ m U_{cispr}$				
Radiated Disturbance @ 10	Radiated Disturbance @ 10 meters					
30 – 1,000 MHz	2.25 dB	4.51 dB				
Radiated Disturbance @ 3 r	neters					
30 – 1,000 MHz	2.26 dB	4.52 dB				
1 – 6 GHz	2.12 dB	4.25 dB				
6 – 18 GHz	2.47 dB 4.93 dB					
Conducted Disturbance @ Mains Terminals						
150 kHz – 30 MHz	1.09 dB	2.18 dB				
Disturbance Power						
30 MHz – 300 MHz	3.92 dB	4.3 dB				

Report Number: 31560640.001 EUT: Wireless Audio Headset, Model: Elite 800X RX

Report Date: April 2, 2015

Voltech PM6000A

The estimated combined standard uncertainty for harmonic current and flicker measurements is $\pm 5.0\%$.	Per CISPR 16-4-2
The estimated combined standard uncertainty for nationic current and fricker measurements is ± 5.0%.	Methods

2.3.3 Measurement Uncertainty Immunity

The estimated combined standard uncertainty for ESD immunity measurements is $\pm8.2\%$.	Per IEC 61000-4-2
The estimated combined standard uncertainty for radiated immunity measurements is ±4.10 dB.	Per IEC 61000-4-3
The estimated combined standard uncertainty for conducted immunity measurements with CDN is \pm 3.66 dB	Per IEC 61000-4-6
The estimated combined standard uncertainty for power frequency magnetic field immunity is \pm 11.6%.	Per IEC 61000-4-8

Thermo KeyTek EMC Pro

The estimated combined standard uncertainty for EFT fast transient immunity measurements is ± 5.84%.

The estimated combined standard uncertainty for surge immunity measurements is \pm 5.84 %.

The estimated combined standard uncertainty for voltage variation and interruption measurements is ± 3.48%.

The expanded uncertainty at a level of 95% confidence is obtained by multiplying the combined standard uncertainty by a coverage factor of 2. Compliance criteria are not based on measurement uncertainty.

Measurement Uncertainty – Radio Testing

The estimated combined standard uncertainty for frequency error measurements is $\pm 3.88~Hz$

The estimated combined standard uncertainty for carrier power measurements is $\pm\,1.59~\text{dB}.$

The estimated combined standard uncertainty for adjacent channel power measurements is \pm 1.47 dB.

The estimated combined standard uncertainty for modulation frequency response measurements is $\pm\,0.46$ dB.

The estimated combined standard uncertainty for transmitter conducted emission measurements is $\pm 4.01~dB$

The expanded uncertainty at a level of 95% confidence is obtained by multiplying the combined standard uncertainty by a coverage factor of 2. Compliance criteria are not based on measurement uncertainty.

2.4 Calibration Traceability

All measurement instrumentation is traceable to the National Institute of Standards and Technology (NIST). Measurement method complies with ANSI/NCSL Z540-1-1994 and ISO Standard 17025:2005.

Report Number: 31560640.001 EUT: Wireless Audio Headset, Model: Elite 800X RX

Report Date: April 2, 2015

3 Product Information

3.1 Product Description

The Elite 800X Wireless Gaming System consists of two main communication modules, the Elite 800X RX ("Headset") and the Elite 800X TX ("Transmitter"). These two modules comprise a closed-loop wireless audio gaming system that utilize a Wi-Fi communication technology to offer wireless streaming audio and chat/talkback capabilities. The Elite 800X RX ("Headset") has an additional Bluetooth feature supporting the mobile configuration.

3.2 Equipment Configuration

A description of the equipment configuration is given in the Test Plan Section. The EUT was tested as called for in the test standard and was configured and operated in a manner consistent with its intended use. The EUT was connected to rated power and allowed to reach intended operating conditions. The placement of the EUT system components was guided by the test standard and selected to represent typical installation conditions.

In the case of a EUT that can operate in more than one configuration, preliminary testing was performed to determine the configuration that produced maximum radiation.

The final configuration was selected to produce the worst case radiation for emissions testing and to place the EUT in the most susceptible state for immunity testing.

3.3 Operating Mode

A description of the operation mode is given in the Test Plan Section. In the case of a EUT that can operate in more than one state, preliminary testing was performed to determine the operating mode that produced maximum radiation.

The final operating mode was selected to produce the worst case radiation for emissions testing and to place the EUT in the most susceptible state for immunity testing.

Report Number: 31560640.001 EUT: Wireless Audio Headset, Model: Elite 800X RX

Report Date: April 2, 2015

FCCID: XGB-TB2390, IC: 3879A-2390

Page 13 of 63

3.4 Unique Antenna Connector

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this Section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited. This requirement does not apply to carrier current devices or to devices operated under the provisions of CFR47 Parts 15.211, 15.213, 15.217, 15.219, or 15.221.

3.4.1 Results

The Elite 800X RX uses the permanently attached PCB trace antennas inside the device. See EUT Photo for details. There is no external antenna connection available.

Report Number: 31560640.001 EUT: Wireless Audio Headset, Model: Elite 800X RX

Report Date: April 2, 2015

4 Emission Requirements – 2400 MHz to 2483.5 MHz Band

Testing was performed in accordance with CFR 47 Part 15.247: 2014 and RSS 210 Annex 8: 2010. These test methods are listed under the laboratory's A2LA Scope of Accreditation. This test measures the levels emanating from the EUT, thus evaluating the potential for the EUT to cause radio frequency interference to other electronic devices. Procedures described in Section 8 of the standard were used.

4.1 Output Power Requirements

The maximum output power requirement is the maximum equivalent isotropic radiated power delivering at the transmitting antenna under specified conditions of measurements in the presence of modulation.

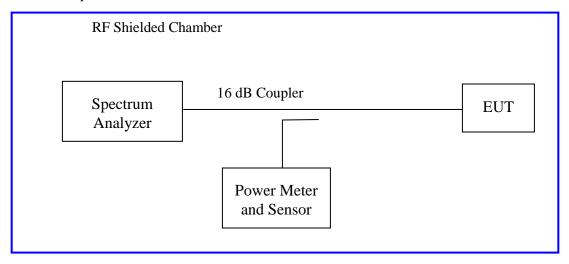

The maximum output power and harmonics shall not exceed CFR47 Part 15.247 (b1) and RSS 210 A.8.1: 2010

Frequency hopping systems in the 2400-2483.5 MHz band: 1 watts.

4.1.1 Test Method

The conducted method was used to measure the channel power output according to ANSI C63.10:2009 Section 6.10.3.1. The measurement was performed with modulation per CFR47 Part 15.247 (b 1):2014 and RSS 210 A.8.1. This test was conducted on 3 channels on Elite 800X RX, SN: PP #1. The worst mode result indicated below.

Test Setup:

Report Number: 31560640.001 EUT: Wireless Audio Headset, Model: Elite 800X RX

Report Date: April 2, 2015

4.1.2 Results

As originally tested, the EUT was found to be compliant to the requirements of the test standard(s).

Figure 2: Maximum Transmitted Power, 2442 MHz

Figure 3: Maximum Transmitted Power, 2480 MHz

4.2 Occupied Bandwidth

The occupied bandwidth is measured at an amplitude level reduced from the reference level by a specified ratio. The reference level is the level of the highest amplitude signal observed from the transmitter at the fundamental frequency.

The 99% bandwidth is the bandwidth in which 99% of the transmitted power occupied.

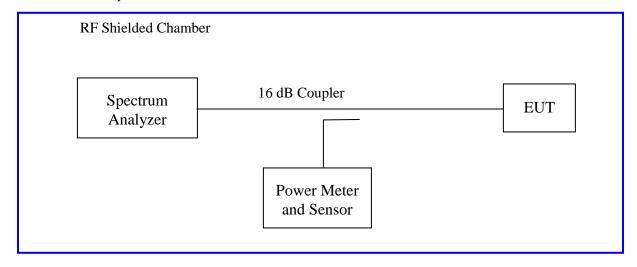

20 dB bandwidth was performed by coupling the output of the EUT to the input of a spectrum analyzer.

4.2.1 Test Method

The conducted method was used to measure the occupied bandwidth. The measurement was performed with modulation per CFR47 15.247(a) (1) 2014 and RSS Gen Sect. 4.4.1:2010. This test was conducted on 3 channels on Elite 800 RX, SN: PP #1. The worst sample result indicated below.

Test Setup:

4.3 Hopping Frequency Requirements

The Frequency Hopping Requirements are applicable to the equipment using Frequency Hopping Spread Spectrum (FHSS) modulation.

Per CFR47 15.247 (a1), RSS 210 Sect.A.8.1.2, frequency hopping systems in the 2400–2483.5 MHz band shall use at least 15 channels. The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW.

The setup was identical to RF output power measurement.

4.3.1 Results

As originally tested, the EUT was found to be compliant to the requirements of the test standard(s).

Table 4: Frequency Hopping Requirements

4.4 Out of Band Emission requirements

The setup was identical to RF output power measurement. Intentional radiators operating under the alternative provisions to the general emission limits, must be designed to ensure that the 20 dB bandwidth of the emission, or whatever bandwidth may otherwise be specified in the specific rule section under which the equipment operates, is contained within the frequency band designated in the rule section under which the equipment is operated. The requirement to contain the designated bandwidth of the emission within the specified frequency band includes the effects from frequency sweeping, frequency hopping and other modulation techniques that may be employed as well as the frequency stability of the transmitter over expected variations in temperature and supply voltage. If the frequency stability is not specified in the regulations, it is recommended that the fundamental emission be kept within at least the central 80% of the permitted band in order to minimize the possibility of out-of-band operation.

Any frequency outside the band of 2400 MHz to 2483.5 MHz, the power output level must be below 20 dB from the in-band transmitting signal; CFR 47 Part 15.215, 15.247(d) and RSS 210 A8.5

The setup was identical to RF output power measurement.

This test was conducted on 3 channels on Elite 800X RX, SN: PP #1.

4.1.1 Results

As originally tested, the EUT was found to be compliant to the requirements of the test standard(s).

4.5 Transmitter Spurious Emissions

Transmitter spurious emissions are emissions outside the frequency range of the equipment when the equipment is in transmitting mode; per requirement of CFR47 15.205, 15.209, 15.247(d), RSS 210 Sect. A.8.5

4.6.1 Test Methodology

4.6.1.1 Preliminary Test

A test program that controls instrumentation and data logging was used to automate the preliminary RF emission test procedure. The frequency range of interest was divided into sub-ranges to yield a frequency resolution of approximately 120 kHz and provide a reading at each frequency for no more than 12° of turntable rotation. For each frequency sub-range the turntable was rotated 360° while peak emission data was recorded and plotted over the frequency range of interest in horizontal and vertical antenna polarization's.

Preliminary emission profile testing was performed inside the anechoic chamber. The EUT was placed on a 1.0m x 1.5m non-conductive table 80cm above the floor. The EUT was positioned as shown in the setup photographs. The receiving antenna was placed at a distance of 3m at a fixed height of 1m. Measurement equipment was located outside of the chamber. A video camera was placed inside the chamber to view the EUT.

4.6.1.2 Final Test

For each frequency measured, the peak emission was maximized by manipulating the receiving antenna from 1 to 4 meters above the ground plane and placing it at the position that produced the maximum signal strength reading. The turntable was then rotated through 360° while observing the peak signal and placing the EUT at the position that produced maximum radiation. The six highest emissions relative to the limit were measured unless such emissions were more than 20 dB below the limit. If less than six emissions are within 20 dB of the limit, than the noise level of the receiver is measured at frequencies where emissions are expected. Multiples of all oscillator and microprocessor frequencies were also checked.

Final testing was performed on an NSA compliant test site. The EUT was placed on a 1.0m x 1.5m non-conductive table 80cm above the ground plane. The placement of EUT and cables were the same as for preliminary testing and is shown in the setup photographs.

The final scans performed on the worst axis, Y-Axis, for three operating channels: 2402 MHz, 2441 MHz, and 2480 MHz at DH5 / 48.

4.6.1.3 Deviations

None.

Report Number: 31560640.001 EUT: Wireless Audio Headset, Model: Elite 800X RX

Report Date: April 2, 2015

4.6.2 Transmitter Spurious Emission Limit

The spurious emissions of the transmitter shall not exceed the values in CFR47 Part 15.205, 15.209: 2013 and RSS 210 A1.1.2 2010.

Measurement Field strength distance (microvolts/meter) (meters) Frequency (MHz) 30 30 3 88-216...... 150 ** 3 3 Above 960..... 500 3

All harmonics and spurious emission which are outside of the restricted band shall be 20 dB below the inband emission.

4.6.3 Test Results

The final measurement data was taken under the worst case operating modes, configurations, and/or cable positions. It also reflects the results including any modifications and/or special accessories listed in Sections 1.4 and Test Plan.

As originally tested, the EUT was found to be compliant to the requirements of the test standard(s).

Notes: 1 GHz – 25 GHz was scanned at 1m distance.

4.6.4 Sample Calculation

The field strength is calculated by subtracting the Amplifier Gain and adding the Cable Loss and Antenna Correction Factor to the measured reading. The basic equation is as follows:

Field Strength $(dB\mu V/m) = FIM - AMP + CBL + ACF$

Where: FIM = Field Intensity Meter ($dB\mu V$)

AMP = Amplifier Gain (dB) CBL = Cable Loss (dB)

ACF = Antenna Correction Factor (dB/m)

 $\mu V/m = 10^{\frac{\textit{dB}\mu V \, / \, \textit{m}}{20}}$

Report Number: 31560640.001 EUT: Wireless Audio Headset, Model: Elite 800X RX

Report Date: April 2, 2015

4.2 AC Conducted Emissions

Testing was performed in accordance with ANSI C63.4: 2010. These test methods are listed under the laboratory's A2LA Scope of Accreditation.

This test measures the levels emanating from the EUT's AC input port, thus evaluating the potential for the EUT to cause radio frequency interference to other electronic devices.

The AC conducted emissions of equipment under test shall not exceed the values in CFR47 Part 15.207: 2013 and RSS-210: 2010.

4.2.1 Test Methodology

A test program that controls instrumentation and data logging was used to automate the AC Power Line Conducted emission test procedure. The frequency range of interest was divided into sub-ranges such as to yield a frequency resolution of 9 kHz. Each phase and neutral of the AC power line were measured with respect to ground. Measurements were performed using a set of $50\mu\text{H}/50\Omega$ LISNs.

Testing is either performed in Lab 2. The setup photographs clearly identify which site was used. The vertical ground plane used in the semi-anechoic chamber is a 2m x 2m solid aluminum frame and panel, and it is bonded to the horizontal ground plane.

In the case of tabletop equipment, the EUT is placed on a 1.0m x 1.5m non-conductive table 80cm above the ground plane and 40cm from a vertical ground reference plane. The rear of the EUT was positioned flush with the backside of the table and directly over the LISNs. The power and I/O cables were routed over the edge of the table and bundled approximately 40cm from the ground plane. Support equipment was powered from a separate LISN.

4.2.1.1 Deviations

There were no deviations from this test methodology.

4.2.2 Test Results

The Elite 800X RX is powered by a 3.7 VDC battery. The AC conducted emission is not required.

Report Number: 31560640.001 EUT: Wireless Audio Headset, Model: Elite 800X RX

Report Date: April 2, 2015

4.3 Maximum Permissible Exposure

4.3.1 Test Methodology

In this section, we try to prove the safety of radiation harmfulness to the human body for our product. The KDB 447498 D01 General RF Exposure Guidance is followed. The Gain of the antenna used in this calculation is declared by the manufacturer, and the maximum average power input to the antenna is measured. Using the general SAR test exclusion guidance in Section 4.3 of KDB 447498, we show the device meeting the SAR exclusion threshold.

4.3.2 FCC KDB 447498 D01 – General SAR Test Exclusion Guidance

The SAR exclusion threshold conditions are listed:

1) The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation
distances ≤ 50 mm are determined by:
[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)]
$[\sqrt{f(GHz)}] \le 3.0$ for 1-g SAR and ≤ 7.5 for 10-g extremity SAR,16 where
☐ f(GHz) is the RF channel transmit frequency in GHz
☐Power and distance are rounded to the nearest mW and mm before calculation17
☐ The result is rounded to one decimal place for comparison
The test exclusions are applicable only when the minimum test separation distance is ≤ 50 mm
and for transmission frequencies between 100 MHz and 6 GHz. When the minimum test
separation distance is $< \hat{5}$ mm, a distance of 5 mm is applied to determine SAR test exclusion.

- 2) At 100 MHz to 6 GHz and for test separation distances > 50 mm, the SAR test exclusion threshold is determined according to the following, and as illustrated in Appendix B:18 a) [Threshold at 50 mm in step 1) + (test separation distance - 50 mm)·(f(MHz)/150)] mW, at 100 MHz to 1500 MHz
- b) [Threshold at 50 mm in step 1) + (test separation distance 50 mm) · 10] mW at > 1500 MHz and \leq 6 GHz
- 3) At frequencies below 100 MHz, the following may be considered for SAR test exclusion, and as illustrated in Appendix C:19
- a) The threshold at the corresponding test separation distance at 100 MHz in step 2) is multiplied by $[1 + \log(100/f(MHz))]$ for test separation distances > 50 mm and < 200 mm
- b) The threshold determined by the equation in a) for 50 mm and 100 MHz is multiplied by ½ for test separation distances ≤ 50 mm
- c) SAR measurement procedures are not established below 100 MHz. When SAR test exclusion cannot be applied, a KDB inquiry is required to determine SAR evaluation requirements for any test results to be acceptable.

4.3.3 EUT Operating Condition

The software provided by Manufacturer enabled the EUT to transmit data at lowest, middle and highest channel individually.

FCCID: XGB-TB2390, IC: 3879A-2390

Report Number: 31560640.001 EUT: Wireless Audio Headset, Model: Elite 800X RX

Report Date: April 2, 2015

4.3.4 Classification

The antenna of the product, under normal use condition, is less than 2cm away from the body of the user. This device is classified as a **Portable Device**. It is intended to be with head wear device; extremity SAR limit is applied.

4.3.5 SAR Test Exclusion Threshold

4.3.5.1 Antenna Gain

The transmitting antennas were integrated. The 2.4GHz antenna gain was +2.8 dBi or 1.91 (numeric), and the 5GHz antenna gain was +1.3 dBi or 1.35 (numeric).

4.3.5.2 SAR Exclusion Threshold Calculation

Mode	Max. Power (dBm)	EIRP (dBm)	Min. Separation Distance (mm)	Cal. Excl. Threshold	1-g SAR Limit	10-g extremity SAR Limit	Result
Bluetooth (2.4GHz)	4.54	7.34	20	0.427073	<u><</u> 3.0	<u><</u> 7.5	Exempted *
802.11A (5GHz)	6.98	8.28	20	0.770257	<u><</u> 3.0	<u><</u> 7.5	Exempted *

Note:

- 1. Per manufacture the separation between the transmitter antenna and user is greater than 2cm. This separation distance was used for calculation per condition #1 of SAR Exclusion Threshold.
- 2. The maximum output power was taken from Table 2.
- 3. (*) The calculated threshold is less than 3.0; therefore, EUT is SAR exempted for head and body usage.

Report Number: 31560640.001 EUT: Wireless Audio Headset, Model: Elite 800X RX

Hardware Version	PP V4.1					
Part Number	AC4343 ES2					
RF Software Version	NA					
	Bluetooth Radio					
Operating Mode	BDR and EDR					
Transmitter Frequency Band	2402 MHz to 2480 MHz					
Operating Bandwidth	1 MHz					
Max. Power Output	4.54 dBm					
Power Setting @ Operating Channel	BDR = 255/46 EDR = 255/48					
Antenna Type	1 integrated PCB antenna					
Antenna Gain	2.8 dBi					
Modulation Type	GFSK, π/4-DQPSK and 8DPSK					
Data Rate	1 Mbps, 2Mbps, and 3Mbps					
Note: This report only documents	the radio characteristics for 2402 - 2480 MHz bands.					

Table 10: Interface Specifications

Interface Type	Cabled with what type of cable?	Is the cable shielded?	Maximum potential length of the cable?	Metallic (M), Coax (C), Fiber (F), or Not Applicable?
USB	USB	⊠ No	Metric: 1 m	\boxtimes M

Report Number: 31560640.001

EUT: Wireless Audio Headset, Model: Elite 800X RX

Report Date: April 2, 2015

 Table 11: Supported Equipment

Equipment	Manufacturer	Model	Serial	Used for
Laptop	Dell	PP23LB	9271001233	Setup EUT operating channel
Interface Board	Turtle Beach	N.A	N.A	Access 2.4GHz radio chipset
Note: None.				

Table 12: Description of Sample used for Testing

Device	Serial	RF Connection	CFR47 Part 15.247
	PP #2	Integrated Antenna	TX Emissions, Rad. Band-edge.
Elite 800X RX	PP #1	Direct via SMA Connection	Transmit Power, Occupied Bandwidth, Out of Band Emission, Hopping Requirement

Table 13: Description of Test Configuration used for Radiated Measurement.

Device	Antenna	Mode	Setup Photo (X-Axis)	Setup Photo (Y-Axis)	Setup Photo (Z-Axis)
Elite 800X RX	Integrated	Transmit	N/A	EUT upright	N/A

Note: The Elite 800X RX is designed and intended to be worn upright. All emission scans performed on the Y-Axis; worst case.

Report Number: 31560640.001

EUT: Wireless Audio Headset, Model: Elite 800X RX

Report Date: April 2, 2015

Table 14: Final Test Mode for 2402 MHz to 2480MHz Channels

Test	802.11a
Occupied Bandwidth CFR 47 15.247(a1), RSS Gen Sect. 4.4.	2402, 2441, 2480 MHz at BDR and EDR
Output Power CFR47 15.247 (b1), RSS 210 Sect. A.8.1	2402, 2441, 2480 MHz at BDR and EDR
Out of Band Emission CFR47 15.247 (d), RSS 210 Sect. A.8.5	2402, 2441, 2480 MHz at BDR and EDR
Hopping Requirements CFR47 15.247 (a1), RSS 210 Sect. A.8.1	2402, 2441, 2480 MHz at BDR and EDR
Band-Edge (Radiated) FCC Part 15.205, 15.209	2402, 2480 MHz at BDR and EDR
Transmitted Spurious Emission (30 MHz – 1GHz) FCC Part 15.205, 15.209	2441 MHz at DH5
Transmitted Spurious Emission (Above 1GHz) FCC Part 15.205, 15.209	2402, 2441, 2480 MHz at DH5
AC Conducted Emission FCC Part 15.207	EUT is powered by a 3.7 VDC battery. Test Not required.

Note: 1. Pretest showed DH5 was the worst case..

2. All radiated emission performed on Y-Axis.

3. All tests were pre-scanned for worst case before final testing.

Report Date: April 2, 2015

7.4 Test Specifications

Testing requirements

Table 15: Test Specifications

Emissions and Immunity				
Standard	Requirement			
CFR 47 Part 15.247: 2014	All
