\*§15.33: The highest internal source of a testing device is defined like more the highest frequency generated or used in the testing device or on which the testing device works or agrees.

- If the highest frequency of the internal sources of the testing device is lower than 108 MHz, measurement must be only performed until 1GHz.
- If the highest frequency of the internal sources of the testing device ranges between 108 MHz and 500 MHz, measurement must be only performed until 2GHz.
- If the highest frequency of the internal sources of the testing device ranges between 500 MHz and 1 GHz, measurement must be only performed until 5GHz.

If the highest frequency of the internal sources of the testing device is above 1 GHz, measurement must be only performed until 5 times the highest frequency or 40 GHz, while taking smallest of both.

L C I E

## 2. SYSTEM TEST CONFIGURATION

### 2.1. JUSTIFICATION

The system was configured for testing in a typical fashion (as a customer would normally use it). The model option under test is the worst case.

### 2.2. HARDWARE IDENTIFICATION

- **Equipment under test (EUT):**

EFT930G-3CXH0102+BAS930P-1NT101

Serial number: 10077PT60457959+10007PT60334013  
FCC ID: XKB-EFT930G

Power supply: FRIWO FW7601/151964, 100-240VAC, 50-60Hz, 5VDC 1A

Power supply: PHIHONG PSA105E-050/251360796, 100-240VAC, 50-60Hz, 5VDC 1A

Internal frequencies: < 500MHz

Dimensions: 180 x 80 x 80 mm

- **Input/output:**

- DC power input (8Vdc) on base
- 1 x Serial link (COM0) on base
- 1x Modem line (LINE IN) on base
- 1x Telephone line OUT on base
- 2 x USB ports on portable terminal
- 2 x SAM port
- 1 x SIM port

- **Cables:**

- 1x DC power supply cable (fixed on mains power unit), unshielded: 2m or 2.8m
- 1x RS232 Com cable, RJ11, unshielded, 1.5m
- 2x USB cables, Mini A&B connectors, shielded: 1m
- 2x Telephone line cables, unshielded, length: 5m and 2m

- **Auxiliaries equipment used during test:**

- Smartcards (EFT Contactless and EMV card)
- SAM cards (x2)
- TELTON Telephone line simulator TLS-5B-01 Sn: 014184
- Universal Communication Tester Rhode & Schwarz CMU200 Sn: 8375860047

**Note: The equipment contains a GPRS module certified (FCCID: VW3HILOC). The transmission GPRS is set in IDLE mode during all the tests.**

### 2.3. EUT CONFIGURATION

The inboard software (EMC TEST) performed the followings tests and activates the followings functions:

- Printer ON
- Smartcards reading: CAM0, SAM1&2 (Power ON and reading)
- USB ON (Host to slave ports looped back)
- Backlight and display are ON
- Modem ON
- Contact less ON (ATR reading in loop)

### 2.4. EQUIPMENT MODIFICATIONS

Added ferrite clamps on following cable:

- Ferrite Würth Elektronik 742 711 12 2 ways near the input power supply port of base. (for both power supplies)

### 2.5. SPECIAL ACCESSORIES

None

### 3. RADIATED EMISSION DATA

#### 3.1. CLIMATIC CONDITIONS

|                      |                              |                            |                            |

#### 3.2. TEST SETUP

The installation of EUT is identical for pre-characterization measurement in a 3 meters semi anechoic chamber and for measures on a 10 meters Open site.

Radiated emission test setup for all configurations

### 3.3. TEST SEQUENCE AND RESULTS

#### 3.3.1. Pre-characterization at 3 meters [9kHz-30MHz]

A pre-scan of all the setup has been performed in a 3 meters semi anechoic chamber. The distance between EUT and antenna is 3 meters. For Pre-characterization, the loop antenna was rotated during the test for maximized the emission measurement. Measurement performed on 3 axis of EUT. Frequency band investigated is 9kHz to 30MHz.

The pre-characterization graphs are obtained in PEAK detection.

See graph for 9kHz-30MHz band:

Emr#1 (See annex 1)

#### 3.3.2. Pre-characterization [30MHz-2GHz]

For frequency band 30MHz to 1GHz, a pre-scan of all the setup has been performed in a 3 meters semi anechoic chamber.

The distance between EUT and antenna is 3 meters. Test is performed in horizontal (H) and vertical (V) polarization with a log-periodic antenna. The EUT is being rotated on 360° and on 3 axis during the measurement. The pre-characterization graphs are obtained in PEAK detection.

For frequency band 1GHz to 2GHz, a search is performed in the semi-anechoic chamber in order to determine frequencies radiated by the EUT (Measuring distance reduced to 1m).

L C I E

**See graphs for 30MHz-1GHz:**

|                |   |               |               |

### 3.3.3. Characterization on 10 meters open site below 30 MHz

The product has been tested according to ANSI C63.4 (2003), FCC part 15 subpart C. Radiated Emissions were measured on an open area test site. A description of the facility is on file with the FCC.

The product has been tested at a distance of **10 meters** from the antenna and compared to the FCC part 15 subpart C §15.225 limits in the frequency range 13.553MHz 13.567MHz. Measurement bandwidth was 9kHz.

Antenna height was 1m for both horizontal and vertical polarization.

Antenna was rotated around its vertical axis.

Continuous linear turntable azimuth search was performed with 360 degrees range. Measurement performed on 3 axis of EUT. A summary of the worst case emissions found in all test configurations and modes is shown on clauses 3.2.

| Frequency (MHz)     | QPeak Limit (dB $\mu$ V/m) @ 30m | Qpeak (dB $\mu$ V/m) | Qpeak-Limit Margin dB | Turntable Angle (deg) | Ant. Pol./Angle (deg) | Tot Corr (dB) |
|---------------------|----------------------------------|----------------------|-----------------------|-----------------------|-----------------------|---------------|
| 13.56 <sup>*1</sup> | 84                               | 39.6                 | <b>-44.4</b>          | 85                    | Parallel              | 35.3          |
| 27.12 <sup>*1</sup> | 29.5                             |                      | No Frequency Observed |                       |                       | 39.3          |

\*1: Measure have been done at 10m distance and corrected according to requirements of 15.209.e) (M@30m = M@10m-19.1dB)

### Limits Sub clause §15.225

| Frequency (MHz) | Field strength ( $\mu$ V/m) | Measurement distance (m) |
|-----------------|-----------------------------|--------------------------|
| 13.553-13.567   | 15 848<br>84 dB $\mu$ V/m   | 30                       |
| 13.410-13.553   | 334                         | 30                       |
| 13.567-13.710   | 50.5 dB $\mu$ V/m           |                          |
| 13.110-13.410   | 106                         | 30                       |
| 13.710-14.010   | 40.5 dB $\mu$ V/m           |                          |

See chapter 5 of this test report for band edge measurements.

L C I E

### 3.3.4. Characterization on 10 meters open site from 30MHz to 2GHz

The product has been tested at a distance of **10 meters** from the antenna and compared to the FCC part 15 subpart B §15.109 limits and C §15.209 limits. Measurement bandwidth was 120kHz from 30 MHz to 1GHz and 1MHz from 1GHz to 12.5GHz.

Antenna height search was performed from 1m to 4m for both horizontal and vertical polarization. Continuous linear turntable azimuth search was performed with 360 degrees range. Measurement performed on 3 axis of EUT.

A summary of the worst case emissions found in all test configurations and modes is shown on clause 3.2

#### Worst case final data result:

Note: Measures have been done at 3m distance.

**RESULTS: PASS**

### 3.4. FIELD STRENGTH CALCULATION

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follow:

$$FS = RA + AF + CF - AG$$

Where      FS = Field Strength  
              RA = Receiver Amplitude  
              AF = Antenna Factor  
              CF = Cable Factor  
              AG = Amplifier Gain

Assume a receiver reading of 52.5dB $\mu$ V is obtained. The antenna factor of 7.4 and a cable factor of 1.1 are added. The amplifier gain of 29dB is subtracted, giving a field strength of 32 dB $\mu$ V/m.

$$FS = 52.5 + 7.4 + 1.1 - 29 = 32 \text{ dB}\mu\text{V/m}$$

The 32 dB $\mu$ V/m value can be mathematically converted to its corresponding level in  $\mu$ V/m.

$$\text{Level in } \mu\text{V/m} = \text{Common Antilogarithm } [(32 \text{ dB}\mu\text{V/m})/20] = 39.8 \mu\text{V/m.}$$

L C I E

## 4. FUNDAMENTAL FREQUENCY TOLERANCE (15.225E)

### 4.1. TEST CONDITIONS

Date of test : June 7<sup>th</sup>, 2010  
Test performed by : A.MERLIN

The frequency tolerance of the carrier signal shall be maintained within  $\pm 0.01\%$  of the operating frequency when the temperature is varied from -20°C to +50°C at the no minal power voltage and the primary power voltage is varied from 85% to 115% of the rated supply voltage at 20°C.

### 4.2. Temperature and voltage fluctuation

Temperature has been set at +20°C, -20°C and +50°C.

Voltage is varied from 102V/60Hz to 138V/60Hz (on base) and 3VDC to 4.1VDC (battery)

Frequency of carrier: 13.56 MHz

Upper limit: 13.561356 MHz

Lower limit: 13.558644 MHz

The equipment (RF box) is set in a climatic chamber. Measure is performed on one channel of RF module.

Frequency drift measured is **166 Hz** when the temperature is varied from -20°C to +50°C and voltage is varied from 120V/60Hz  $\pm 15\%$ .

## 5. BAND-EDGE COMPLIANCE §15.209

### 5.1. CLIMATIC CONDITIONS

Date of test : May 6<sup>th</sup>, 2010  
Test performed by : A.MERLIN  
Atmospheric pressure : 940mb  
Relative humidity : 34%  
Ambient temperature : 21°C

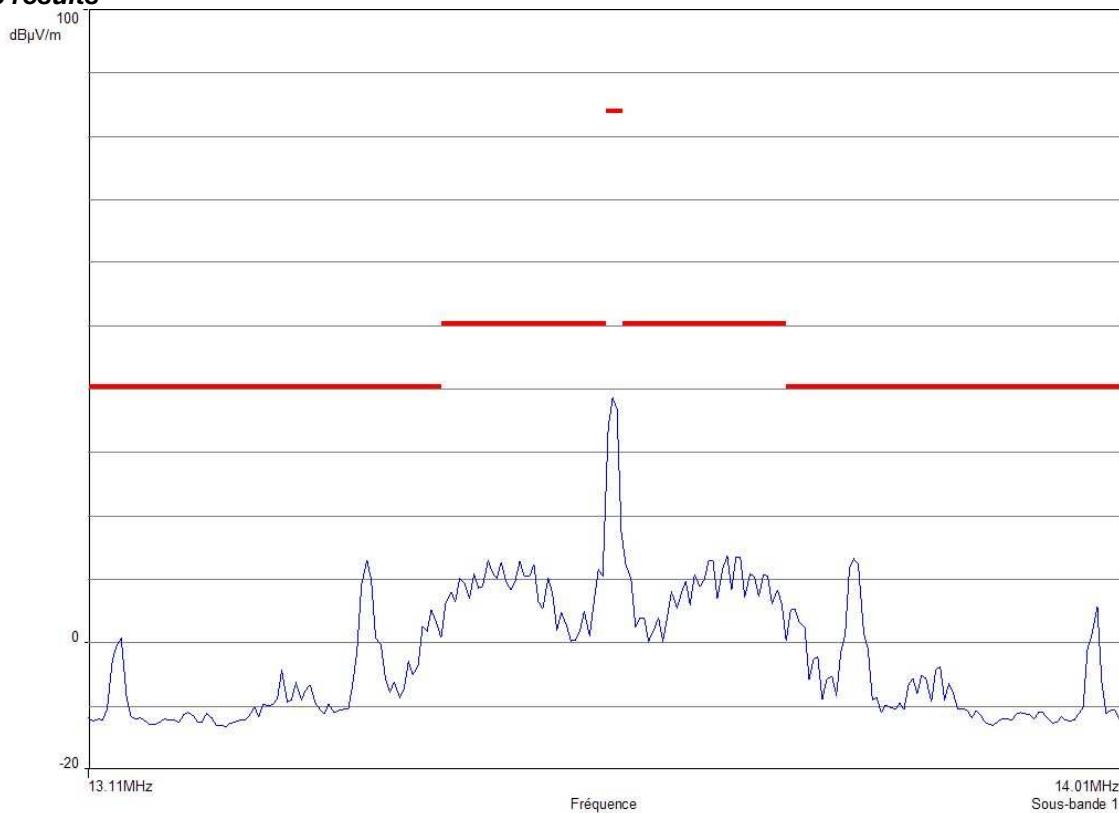

### 5.2. EQUIPMENT CONFIGURATION

See § 2.3.

### 5.3. Frequency band 13.110-14.010MHz

Following plots show radiated emission level in the frequency band 13.110-14.010MHz with a RBW of 9kHz and a quasi-peak detector. The graphs are obtained with a measuring receiver ESU8.

#### Worst case results

## 6. CONDUCTED EMISSION DATA

### 6.1. CLIMATIC CONDITIONS

Date of test : June 8<sup>th</sup>, 2010  
Test performed by : A.MERLIN  
Atmospheric pressure : 975mb  
Relative humidity : 40%  
Ambient temperature : 22°C

### 6.2. SETUP FOR CONDUCTED EMISSIONS MEASUREMENT

The product has been tested according to ANSI C63.4-(2003) and FCC Part 15 subpart B and C.

The product has been tested with 120V/60Hz power line voltage and compared to the FCC Part 15 subpart B §15.107 and C §15.207 limits. Measurement bandwidth was 9kHz from 150 kHz to 30 MHz.

Measurement is made with a Rohde & Schwarz ESU8 receiver in peak mode. This was followed by a Quasi-Peak, i.e. CISPR measurement for any strong signal. If the average limit is met when using a Quasi-Peak detector, the EUT shall be deemed to meet both limits and measurement with the average detector is unnecessary. The LISN (measure) is 50Ω / 50µH.

The Peak data are shown on plots in annex 1. Quasi-Peak and Average measurements are detailed in a table with frequencies and levels measured.

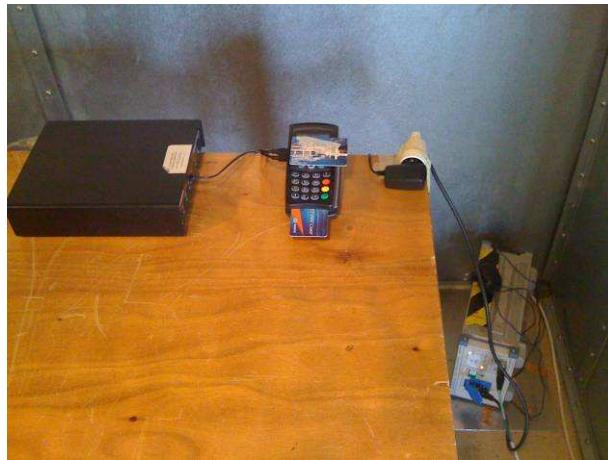

Interconnecting cables and equipment's were moved to position that maximized emission. A summary of the worst case emissions found in all test configurations and modes is shown on the following page.

### 6.3. TEST SETUP

The EUT is placed on the ground reference plane, at 80cm from the LISN. The distance between the EUT and the vertical ground plane is 40cm.

Auxiliaries are powered by another LISN.

The cable has been shorted to 1meter length. The EUT is powered trough the LISN (measure).

Conducted emission test setup for all configurations

#### 6.4. TEST SEQUENCE AND RESULTS

Measurements are performed on the phase (L1) and neutral (N) of power line voltage.  
Graphs are obtained in PEAK detection.

Measures are also performed in Quasi-Peak and Average for any strong signal.

## 9. UNCERTAINTIES CHART

| Type de mesure / Kind of measurement   | Incertitude élargie laboratoire /<br>Wide uncertainty laboratory<br>(k=2) ± x | Incertitude limite du CISPR /<br>CISPR uncertainty limit<br>± y |
|--|---|---|
| Mesure des perturbations conduites en tension sur le réseau d'énergie<br><i>Measurement of conducted disturbances in voltage on the power port</i>                         | 3.57 dB   | 3.6 dB  |
| Mesure des perturbations conduites en tension sur le réseau de télécommunication<br><i>Measurement of conducted disturbances in voltage on the telecommunication port.</i> | 3.28 dB   | A l'étude /<br>Under consid.                                    |
| Mesure des perturbations discontinues conduites en tension<br><i>Measurement of discontinuous conducted disturbances in voltage</i>  | 3.47 dB   | 3.6 dB  |
| Mesure des perturbations conduites en courant<br><i>Measurement of conducted disturbances in current</i>   | 2.90 dB   | A l'étude /<br>Under consid.                                    |
| Mesure du champ électrique rayonné sur le site en espace libre de Moirans<br><i>Measurement of radiated electric field on the Moirans open area test site</i>              | 5.07 dB   | 5.2 dB  |
