2 General information

2.1 Notes and disclaimer

The test results of this test report relate exclusively to the test item specified in this test report. CTC advanced GmbH does not assume responsibility for any conclusions and generalisations drawn from the test results with regard to other specimens or samples of the type of the equipment represented by the test item. The test report may only be reproduced or published in full. Reproduction or publication of extracts from the report requires the prior written approval of CTC advanced GmbH.

This test report is electronically signed and valid without handwriting signature. For verification of the electronic signatures, the public keys can be requested at the testing laboratory.

The testing service provided by CTC advanced GmbH has been rendered under the current "General Terms and Conditions for CTC advanced GmbH".

CTC advanced GmbH will not be liable for any loss or damage resulting from false, inaccurate, inappropriate or incomplete product information provided by the customer.

Under no circumstances does the CTC advanced GmbH test report include any endorsement or warranty regarding the functionality, quality or performance of any other product or service provided.

Under no circumstances does the CTC advanced GmbH test report include or imply any product or service warranties from CTC advanced GmbH, including, without limitation, any implied warranties of merchantability, fitness for purpose, or non-infringement, all of which are expressly disclaimed by CTC advanced GmbH.

All rights and remedies regarding vendor's products and services for which CTC advanced GmbH has prepared this test report shall be provided by the party offering such products or services and not by CTC advanced GmbH. In no case this test report can be considered as a Letter of Approval.

2.3 Statement of compliance

The SAR values found for the Move/5000 or Move/3500 CL/3G/WiFi/BT/GPS/Camera or BCR Payment Terminal are below the maximum recommended levels of 1.6 W/Kg as averaged over any 1 g tissue according to the FCC rule §2.1093, the ANSI/IEEE C 95.1:1992, the NCRP Report Number 86 for uncontrolled environment, according to the Health Canada's Safety Code 6 and the Industry Canada Radio Standards Specification RSS-102 for General Population/Uncontrolled exposure.

3.1 RF exposure limits

| Human Exposure | Uncontrolled Environment General Population | Controlled Environment Occupational |
|---|--|--|
| Spatial Peak SAR* (Brain and Trunk) | 1.60 mW/g | 8.00 mW/g |
| Spatial Average SAR** (Whole Body) | 0.08 mW/g | 0.40 mW/g |
| Spatial Peak SAR*** (Hands/Feet/Ankle/Wrist) | 4.00 mW/g | 20.00 mW/g |

Table 2: RF exposure limits

The limit applied in this test report is shown in bold letters

Notes:

- The Spatial Peak value of the SAR averaged over any 1 gram of tissue (defined as a tissue volume in the shape of a cube) and over the appropriate averaging time
- ** The Spatial Average value of the SAR averaged over the whole body.
- *** The Spatial Peak value of the SAR averaged over any 10 grams of tissue (defined as a tissue volume in the shape of a cube) and over the appropriate averaging time.

Uncontrolled Environments are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure.

Controlled Environments are defined as locations where there is exposure that may be incurred by persons who are aware of the potential for exposure, (i.e. as a result of employment or occupation).

4 Summary of Measurement Results

| \square | No deviations from the technical specifications ascertained | | | | | | | |
|-----------------------|---|-------|-------|-------|--|--|--|--|
| | Deviations from the technical specifications ascertained | | | | | | | |
| | Maximum SAR value reported for 10g (W/kg) | | | | | | | |

6 Test Set-up

6.1 Measurement system

6.1.1 System Description

- The DASY system for performing compliance tests consists of the following items:
- A standard high precision 6-axis robot (Stäubli RX/TX family) with controller and software. An arm extension for accommodating the data acquisition electronics (DAE).
- A dosimetric probe, i.e. an isotropic E-field probe optimized and calibrated for usage in tissue simulating liquid.
- A data acquisition electronic (DAE) which performs the signal amplification, signal multiplexing, ADconversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
- The <u>Electro-Optical Coupler (EOC)</u> performs the conversion from the optical into a digital electric signal of the DAE. The EOC is connected to the DASY measurement server.
- The DASY measurement server, which performs all real-time data evaluation for field measurements and surface detection, controls robot movements and handles safety operation. A computer operating Windows 7.
- DASY software and SEMCAD data evaluation software.
- Remote control with teach panel and additional circuitry for robot safety such as warning lamps, etc.
- The generic twin phantom enabling the testing of left-hand and right-hand usage.
- The triple flat and eli phantom for the testing of handheld and body-mounted wireless devices.
- The device holder for handheld mobile phones and mounting device adaptor for laptops
- Tissue simulating liquid mixed according to the given recipes.
- System check dipoles allowing to validate the proper functioning of the system.

6.1.2 Test environment

The DASY measurement system is placed in a laboratory room within an environment which avoids influence on SAR measurements by ambient electromagnetic fields and any reflection from the environment. The pictures at the beginning of the photo documentation show a complete view of the test environment. The system allows the measurement of SAR values larger than 0.005 mW/g.

6.1.4 Phantom description

The used SAM Phantom meets the requirements specified in FCC KDB865664 D01 for Specific Absorption Rate (SAR) measurements.

The phantom consists of a fibreglass shell integrated in a wooden table. It allows left-hand and right-hand head as well as body-worn measurements with a maximum liquid depth of 18 cm in head position and 22 cm in planar position (body measurements). The thickness of the Phantom shell is 2 mm +/- 0.1 mm.

- ear reference point right hand side

CTC

ear reference point left hand side

reference point flat position

Triple Modular Phantom consists of three identical modules which can be installed and removed separately without emptying the liquid. It includes three reference points for phantom installation. Covers prevent evaporation of the liquid. Phantom material is resistant to DGBE based tissue simulating liquids.

RWTÜV group

6.1.5 Device holder description

The DASY device holder has two scales for device rotation (with respect to the body axis) and the device inclination (with respect to the line between the ear openings). The plane between the ear openings and the mouth tip has a rotation angle of 65°. The bottom plate contains three pair of bolts for locking the device holder. The device holder positions are adjusted to the standard measurement positions in the three sections. This device holder is used for standard mobile phones or PDA's only. If necessary an additional support of polystyrene material is used.

Larger DUT's (e.g. notebooks) cannot be tested using this device holder. Instead a support of bigger polystyrene cubes and thin polystyrene plates is used to position the DUT in all relevant positions to find and measure spots with maximum SAR values.

Therefore those devices are normally only tested at the flat part of the SAM.

6.1.6 Scanning procedure

- The DASY installation includes predefined files with recommended procedures for measurements and system check. They are read-only document files and destined as fully defined but unmeasured masks. All test positions (head or body-worn) are tested with the same configuration of test steps differing only in the grid definition for the different test positions.
- The "reference" and "drift" measurements are located at the beginning and end of the batch process. They measure the field drift at one single point in the liquid over the complete procedure. The indicated drift is mainly the variation of the DUT's output power and should vary max. +/- 5 %.
- The highest integrated SAR value is the main concern in compliance test applications. These values can mostly be found at the inner surface of the phantom and cannot be measured directly due to the sensor offset in the probe. To extrapolate the surface values, the measurement distances to the surface must be known accurately. A distance error of 0.5mm could produce SAR errors of 6% at 1800 MHz. Using predefined locations for measurements is not accurate enough. Any shift of the phantom (e.g., slight deformations after filling it with liquid) would produce high uncertainties. For an automatic and accurate detection of the phantom surface, the DASY5 system uses the mechanical surface detection. The detection is always at touch, but the probe will move backward from the surface the indicated distance before starting the measurement.
- The "area scan" measures the SAR above the DUT or verification dipole on a parallel plane to the surface. It is used to locate the approximate location of the peak SAR with 2D spline interpolation. The robot performs a stepped movement along one grid axis while the local electrical field strength is measured by the probe. The probe is touching the surface of the SAM during acquisition of measurement values. The scan uses different grid spacings for different frequency measurements. Standard grid spacing for head measurements in frequency ranges ≤ 2GHz is 15 mm in x- and y- dimension. For higher frequencies a finer resolution is needed, thus for the grid spacing is reduced according the following table:

| Area scan grid spacing | for different frequency ranges |
|------------------------|--------------------------------|
| Frequency range | Grid spacing |
| ≤ 2 GHz | ≤ 15 mm |
| 2 – 4 GHz | ≤ 12 mm |
| 4 – 6 GHz | ≤ 10 mm |

Grid spacing and orientation have no influence on the SAR result. For special applications where the standard scan method does not find the peak SAR within the grid, e.g. mobile phones with flip cover, the grid can be adapted in orientation. Results of this coarse scan are shown in annex B.

• A "zoom scan" measures the field in a volume around the 2D peak SAR value acquired in the previous "coarse" scan. It uses a fine meshed grid where the robot moves the probe in steps along all the 3 axis (x, y and z-axis) starting at the bottom of the Phantom. The grid spacing for the cube measurement is varied according to the measured frequency range, the dimensions are given in the following table:

| Zoom scan grid spacing and volume for different frequency ranges | | | | | | | | | | |
|--|----------------------------|-------------------------|--------------------------|--|--|--|--|--|--|--|
| Frequency range | Grid spacing for x, y axis | Grid spacing for z axis | Minimum zoom scan volume | | | | | | | |
| ≤ 2 GHz | ≤ 8 mm | ≤ 5 mm | ≥ 30 mm | | | | | | | |
| 2 – 3 GHz | ≤ 5 mm* | ≤ 5 mm | ≥ 28 mm | | | | | | | |
| 3 – 4 GHz | ≤ 5 mm* | ≤ 4 mm | ≥ 28 mm | | | | | | | |
| 4 – 5 GHz | ≤ 4 mm* | ≤ 3 mm | ≥ 25 mm | | | | | | | |
| 5 – 6 GHz | ≤ 4 mm* | ≤ 2 mm | ≥ 22 mm | | | | | | | |

* When zoom scan is required and the reported SAR from the area scan based 1-g SAR estimation procedures of KDB Publication 447498 is \leq 1.4 W/kg, \leq 8 mm, \leq 7 mm and \leq 5 mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz.

DASY is also able to perform repeated zoom scans if more than 1 peak is found during area scan. In this document, the evaluated peak 1g and 10g averaged SAR values are shown in the 2D-graphics in annex B. Test results relevant for the specified standard (see section 3) are shown in table form in section 7.

6.1.7 Spatial Peak SAR Evaluation

The spatial peak SAR - value for 1 and 10 g is evaluated after the Cube measurements have been done. The basis of the evaluation are the SAR values measured at the points of the fine cube grid consisting of all points in the three directions x, y and z. The algorithm that finds the maximal averaged volume is separated into three different stages.

- The data between the dipole center of the probe and the surface of the phantom are extrapolated. This data cannot be measured since the center of the dipole is 1 to 2.7 mm away from the tip of the probe and the distance between the surface and the lowest measuring point is about 1 mm (see probe calibration sheet). The extrapolated data from a cube measurement can be visualized by selecting 'Graph Evaluated'.
- The maximum interpolated value is searched with a straight-forward algorithm. Around this maximum the SAR values averaged over the spatial volumes (1g or 10 g) are computed using the 3d-spline interpolation algorithm. If the volume cannot be evaluated (i.e., if a part of the grid was cut off by the boundary of the measurement area) the evaluation will be started on the corners of the bottom plane of the cube.
- All neighbouring volumes are evaluated until no neighbouring volume with a higher average value is found.

Extrapolation

The extrapolation is based on a least square algorithm [W. Gander, Computermathematik, p.168-180]. Through the points in the first 3 cm along the z-axis, polynomials of order four are calculated. These polynomials are then used to evaluate the points between the surface and the probe tip. The points, calculated from the surface, have a distance of 1 mm from each other.

Interpolation

The interpolation of the points is done with a 3d-Spline. The 3d-Spline is composed of three one-dimensional splines with the "Not a knot"-condition [W. Gander, Computermathematik, p.141-150] (x, y and z -direction) [Numerical Recipes in C, Second Edition, p.123ff].

Volume Averaging

At First the size of the cube is calculated. Then the volume is integrated with the trapezoidal algorithm. 8000 points (20x20x20) are interpolated to calculate the average.

Advanced Extrapolation

DASY uses the advanced extrapolation option which is able to compensate boundary effects on E-field probes.

CTC

6.1.8 Data Storage and Evaluation

Data Storage

The DASY software stores the acquired data from the data acquisition electronics as raw data (in microvolt readings from the probe sensors), together with all necessary software parameters for the data evaluation (probe calibration data, liquid parameters and device frequency and modulation data) in measurement files with the extension ".DA4", ".DA5x". The software evaluates the desired unit and format for output each time the data is visualized or exported. This allows verification of the complete software setup even after the measurement and allows correction of incorrect parameter settings. For example, if a measurement has been performed with a wrong crest factor parameter in the device setup, the parameter can be corrected afterwards and the data can be re-evaluated.

The measured data can be visualized or exported in different units or formats, depending on the selected probe type ([V/m], [A/m], [°C], [mW/g], [mW/cm²], [dBrel], etc.). Some of these units are not available in certain situations or show meaningless results, e.g., a SAR output in a lossless media will always be zero. Raw data can also be exported to perform the evaluation with other software packages.

Data Evaluation by SEMCAD

The SEMCAD software automatically executes the following procedures to calculate the field units from the microvolt readings at the probe connector. The parameters used in the evaluation are stored in the configuration modules of the software:

| Probe parameters: | Norm _i , a _{i0} , a _{i1} , a _{i2} ConvF _i | |
|--------------------|---|----------|
| | - Diode compression point | Dcpi |
| Device parameters: | - Frequency | f |
| | - Crest factor | cf |
| Media parameters: | - Conductivity | σ |
| | - Density | ρ |

These parameters must be set correctly in the software. They can be found in the component documents or they can be imported into the software from the configuration files issued for the DASY components. In the direct measuring mode of the multimeter option, the parameters of the actual system setup are used. In the scan visualization and export modes, the parameters stored in the corresponding document files are used.

The first step of the evaluation is a linearization of the filtered input signal to account for the compression characteristics of the detector diode. The compensation depends on the input signal, the diode type and the DC-transmission factor from the diode to the evaluation electronics.

If the exciting field is pulsed, the crest factor of the signal must be known to correctly compensate for peak power. The formula for each channel can be given as:

$$V_i = U_i + U_i^2 \cdot cf/dcp_i$$

CTC

 $\mathsf{P}_{\mathsf{pwe}} = H_{tot}^2 \cdot 37.7$

| with | V _i U _i cf | compensated signal of channel i input signal of channel i crest factor of exciting field | (i = x, y, z) (i = x, y, z) (DASY parameter) |
|------|--|--|--|
| | | = diode compression point | (DASY parameter) |

From the compensated input signals the primary field data for each channel can be evaluated:

| E-field probes: | $E_i = (V_i / Norm_i \cdot ConvF)^{1/2}$ |
|-----------------|--|
| H-field probes: | $H_i = (V_i)^{1/2} \cdot (a_{i0} + a_{i1}f + a_{i2}f^2)/f$ |

| with | V _i Norm _i | = compensated signal of channel i = sensor sensitivity of channel i | (i = x, y, z) (i = x, y, z) |
|------|-------------------------------------|--|--------------------------------|
| | | [mV/(V/m) ²] for E-field Probes | |
| | ConvF | = sensitivity enhancement in solution | |
| | a _{ii} | = sensor sensitivity factors for H-field probes | |
| | f | = carrier frequency [GHz] | |
| | Ei | = electric field strength of channel i in V/m | |
| | Hi | = magnetic field strength of channel i in A/m | |

The RSS value of the field components gives the total field strength (Hermitian magnitude):

$$E_{tot} = (E_x^2 + E_Y^2 + E_z^2)^{1/2}$$

The primary field data are used to calculate the derived field units.

$$SAR = (E_{tot}^2 \cdot \sigma) / (\rho \cdot 1000)$$

| with | SAR E _{tot} | local specific absorption rate in mW/g total field strength in V/m |
|------|-------------------------|---|
| | σ | = conductivity in [mho/m] or [Siemens/m] |
| | ho | = equivalent tissue density in g/cm ³ |

Note that the density is normally set to 1 (or 1.06), to account for actual brain density rather than the density of the simulation liquid. The power flow density is calculated assuming the excitation field to be a free space field.

$$P_{pwe} = E_{tot}^{2} / 3770$$
 or

with

P_{pwe} = equivalent power density of a plane wave in mW/cm² Etot = total electric field strength in V/m

H_{tot} = total magnetic field strength in A/m

6.1.9 Tissue simulating liquids: dielectric properties

Table 6: Measurement uncertainties

Worst-Case uncertainty budget for DASY5 assessed according to IEEE 1528/2013

and IEC 62209-1/2011 standards. The budget is valid for the frequency range 300MHz -3 GHz and represents a worst-case analysis. For specific tests and configurations, the uncertainty could be considerable smaller.

Table 8: Measurement uncertainties of the System Check with DASY5 (0.3-3GHz)

Note: Worst case probe calibration uncertainty has been applied for all probes used during the measurements.

CETECOM ICT Services is now

6.1.13 System check

The system check is performed for verifying the accuracy of the complete measurement system and performance of the software. The system check is performed with tissue equivalent material according to IEEE 1528. The following table shows system check results for all frequency bands and tissue liquids used during the tests (plot(s) see annex A).

Table 9: Results system check

CETECOM ICT Services is now

6.1.14 System check procedure

The system check is performed by using a validation dipole which is positioned parallel to the planar part of the SAM phantom at the reference point. The distance of the dipole to the SAM phantom is determined by a plexiglass spacer. The dipole is connected to the signal source consisting of signal generator and amplifier via a directional coupler, N-connector cable and adaption to SMA. It is fed with a power of 1000 mW for frequencies below 2 GHz or 100 mW for frequencies above 2 GHz. To adjust this power a power meter is used. The power sensor is connected to the cable before the system check to measure the power at this point and do adjustments at the signal generator. At the outputs of the directional coupler both return loss as well as forward power are controlled during the validation to make sure that emitted power at the dipole is kept constant. This can also be checked by the power drift measurement after the test (result on plot).

System check results have to be equal or near the values determined during dipole calibration (target SAR in table above) with the relevant liquids and test system.

CETECOM ICT Services is now

advanced

CTC I

6.1.15 System validation

The system validation is performed in a similar way as a system check. It needs to be performed once a SAR measurement system has been established and allows an evaluation of the system accuracy with all components used together with the specified system. It has to be repeated at least once a year or when new system components are used (DAE, probe, phantom, dipole, liquid type).

In addition to the procedure used during system check a system validation also includes checks of probe isotropy, probe modulation factor and RF signal.

Probe Calibrated Frequency DASY Dipole DAE unit body Type / signal (MHz) SW Type /SN Type / SN validation SN type(s) EX3DV4 D835V2 / DAE3/ V52.8.7 CW 835 2016-08-31 4d153 / 3944 477 D835V2 / ES3DV3 DAE3/ 835 V52.8.7 CW 2017-01-20 4d153 / 3320 413 D1900V2 ES3DV3 DAE3/ 1900 V52.8.7 CW 2017-02-07 / 5d009 / 3320 413 ES3DV3 D2450V2 DAE3 / V52.8.7 2450 CW 2017-02-13 / 710 / 3320 413

7 Detailed Test Results

7.1 Conducted power measurements

For the measurements the Rohde & Schwarz Radio Communication Tester CMU 200 and NRP Power Meter were used.

The output power was measured using an integrated RF connector and attached RF cable.

The conducted output power was also checked before and after each SAR measurement. The resulting power values were within a 0.2 dB tolerance of the values shown below.

Note: CMU200 measures GSM peak and average output power for active timeslots.

For SAR the time based average power is relevant. The difference in-between depends on the duty cycle of the TDMA signal:

| No. of timeslots | 1 | 2 | 3 | 4 |
|--|-----------|-----------|-----------|-----------|
| Duty Cycle | 1:8 | 1: 4 | 1 : 2.66 | 1:2 |
| time based avg. power compared to slotted avg. power | - 9.03 dB | - 6.02 dB | - 4.26 dB | - 3.01 dB |

The signalling modes differ as follows:

| mode | coding scheme | modulation |
|--------------|---------------|------------|
| GPRS | CS1 to CS4 | GMSK |
| EGPRS (EDGE) | MCS1 to MCS4 | GMSK |
| EGPRS (EDGE) | MCS5 to MCS9 | 8PSK |

Apart from modulation change (GMSK/8PSK) coding schemes differ in code rate without influence on the RF signal. Therefore one coding scheme per mode was selected for conducted power measurements.

| | Conducted output power GSM 850 MHz (dBm) | | | | | | | |
|----|--|----------------|---------------|--------------|-------------|--------|--------------|--------|

7.1.4 Conducted power measurements WCDMA FDD II (1900 MHz)

Table 13: Test results conducted power measurement UMTS FDD II 1900MHz

Remark: None of the HSDPA/HSUPA settings leads to conducted power values exceeding the conducted power in RMC mode by more than 0.25 dB.

Therefore no additional SAR measurements were performed in HSDPA/HSUPA mode.

CTC

advanced

7.1.5 Test-set-up information for WCDMA / HSPDA / HSUPA

a) WCDMA RMC

In RMC (reference measurement channel) mode the conducted power at 4 different bit rates was measured. They correspond with the used spreading factors as follows:

| Bit rate | 12.2 kbit/s | 64 kbit/s | 144 kbit/s | 384 <i>k</i> bit/s |
|-----------------------|-------------|-----------|------------|--------------------|
| Spreading factor (SF) | 64 | 16 | 8 | 4 |

In RMC mode only DPCCH and DPDCH are active. As bit rate changes do not influence the relative power of any code channel the measured RMS output power remains on the same level which is set to maximum by TPC (Transmit power control) pattern type 'All 1'.

b) HSDPA

HSDPA adds the HS-DPCCH in uplink as a control channel for high speed data transfer in downlink. In HSDPA mode 4 sub-tests are defined by 3GPP 34.121 according to the following table:

| Sub-test | βα | βa | β ⋴ (SF) | βσ/βα | $\beta_{hs}^{(1)}$ | CM(dB) ⁽²⁾ | | |
|-----------------------------------|---|---|--------------------------|------------------------------|--------------------|-----------------------|--|--|
| 1 | 2/15 | 15/15 | 64 | 2/15 | 4/15 | 0.0 | | |
| 2 | 12/15 ⁽³⁾ | 15/15 ⁽³⁾ | 64 | 12/15 ⁽³⁾ | 24/15 | 1.0 | | |
| 3 | 15/15 | 8/15 | 64 | 15/8 | 30/15 | 1.5 | | |
| 4 | 15/15 | 4/15 | 64 | 15/4 | 30/15 | 1.5 | | |
| Note 1: Δ_{ACK} , Δ | $\Delta_{\rm NACK}, \Delta_{\rm CQI} = 8 < 100$ | $\Rightarrow A_{hs} = \beta_{hs}/\beta$ | B _c =30/15 ⇐⇒ | $\beta_{hs} = 30/15 * \beta$ | с | | | |
| Note $2:CM =$ | 1 for $\beta_c/\beta_d = 12$ | $1/15, \beta_{hs}/\beta_{c} = 24$ | I /15 | | | | | |
| Note 3 : For su | Note 3 : For subtest 2 the β_c/β_d ratio of 12/15 for the TFC during the measurement period (TF1, TF0) is | | | | | | | |
| achieved by se 15/15 | achieved by setting the signalled gain factors for the reference TFC (TF1,TF1) to $\beta_c = 11/15$ and $\beta_d =$ | | | | | | | |

Table 14: Sub-tests for UMTS Release 5 HSDPA

The β_c and β_d gain factors for DPCCH and DPDCH were set according to the values in the above table, β_{hs} for HS-DPCCH is set automatically to the correct value when Δ_{ACK} , Δ_{NACK} , $\Delta_{CQI} = 8$. The variation of the β_c/β_d ratio causes a power reduction at sub-tests 2 - 4.

The measurements were performed with a Fixed Reference Channel (FRC) and H-Set 1 QPSK.

| Parameter | Value |
|----------------------------------|-------------|
| Nominal average inf. bit rate | 534 kbit/s |
| Inter-TTI Distance | 3 TTI's |
| Number of HARQ Processes | 2 Processes |
| Information Bit Payload | 3202 Bits |
| MAC-d PDU size | 336 Bits |
| Number Code Blocks | 1 Block |
| Binary Channel Bits Per TTI | 4800 Bits |
| Total Available SMLs in UE | 19200 SMLs |
| Number of SMLs per HARQ Process | 9600 SMLs |
| Coding Rate | 0.67 |
| Number of Physical Channel Codes | 5 |

Table 15: settings of required H-Set 1 QPSK acc. to 3GPP 34.121

advanced

c) HSUPA

In HSUPA mode additional code channels (E-DPCCH, E-DPDCHn) are added for data transfer in uplink at higher bit rates.

5 sub-tests are defined by 3GPP 34.121 according to the following table:

| Sub- | β _c | β _d | β _d (SF) | β _α /β _d | $\beta_{hs}^{(1)}$ | β _{ec} | β_{ed} | β_{ec} | β_{ed} | CM ⁽²⁾ | MPR | AG ⁽⁴⁾ | E-TFCI |

Note 5 : Testing UE using E-DPDCH Physical Layer category 1 Sub-test 3 is not required according to TS 25.306 Table 5.1g Note 6 : β_{ed} can not be set directly; it is set by Absolute Grant Value

Table 16: Subtests for UMTS Release 6 HSUPA

To achieve the settings above some additional procedures were defined by 3GPP 34.121. Those have been included in an application note for the CMU200 and were exactly followed:

- Test mode connection (BS signal tab):

- RMC 12.2 kbit/s + HSPA 34.108 with loop mode 1
- HS-DSCH settings (BS signal tab):
- FRC with H-set 1 QPSK
- ACK-NACK repetition factor = 3
- CQI feedback cycle = 4ms
- CQI repetition factor = 2
- HSUPA-specific signalling settings (UE signal tab):
- E-TFCI table index = 0
- E-DCH minimum set E-TFCI = 9
- Puncturing limit non-max = 0.84
- max. number of channelisation codes = 2x SF4
- Initial Serving Grant Value = Off
- HSDPA and HSUPA Gain factors (UE signal tab)

| Sub-test | βα | βd | Δ аск, $\Delta_{ m N}$ аск, Δ сqi | ∆E–DPCCH)* |
|----------|----|----|---|------------|
| 1 | 10 | 15 | 8 | 6 |
| 2 | 6 | 15 | 8 | 8 |
| 3 | 15 | 9 | 8 | 8 |
| 4 | 2 | 15 | 8 | 5 |
| 5 | 14 | 15 | 8 | 7 |

)* : β_{ec} and β_{ed} ratios (relative to β_c and β_d) are set by ΔE -DPCCH

advanced

- HSUPA Reference E-TFCIs (UE signal tab > HSUPA gain factors):

| Sub-test | 1, 2, 4, 5 | | | | | | | | |
|----------------------------------|------------|----|----|----|----|--|--|--|--|
| Number of E-TFCIs | | | 5 | | | | | | |
| Reference E-TFCI | 11 | 67 | 71 | 75 | 81 | | | | |
| Reference E-TFCI power offset | 4 | 18 | 23 | 26 | 27 | | | | |
| | | | | | | | | | |
| Sub-test | | | 3 | | | | | | |
| Number of E-TFCIs | | | 2 | | | | | | |
| Reference E-TFCI | | 11 | | 92 | | | | | |
| Reference E-TFCI power offset | | 4 | | 18 | | | | | |

- HSUPA-specific generator parameters (BS Signal tab > HSUPA > E-AGCH > AG Pattern)

| Sub-test | Absolute Grant Value (AG Index) |
|----------|---------------------------------|
| 1 | 20 |
| 2 | 12 |
| 3 | 15 |
| 4 | 17 |
| 5 | 21 |

- Power Level settings (BS Signal tab > Node B-settings):

- Level reference: Output Channel Power (lor)
- Output Channel Power (lor): -86 dBm
- Downlink Physical Channel Settings (BS signal tab)
- P-CPICH: -10 dB
- S-CPICH: Off
- P-SCH: -15 dB
- S-SCH : -15 dB
- P-CCPCH: -12 dB
- S-CCPCH: -12 dB
- PICH : -15 dB
- AICH : -12 dB
- DPDCH : -10 dB
- HS-SCCH : -8 dB
- HS-PDSCH : -3 dB
- E-AGCH : -20 dB
- E-RGCH/E-HICH 20 dB
- E-RGCH Active: Off

The settings above were stored once for each sub-test and recalled before the measurement.

HSUPA test procedure:

To reach maximum output power in HSUPA mode the following procedures were followed:

3 different TPC patterns were defined: Set 1: Closed loop with target power 10 dBm

Set 2: Single Pattern+Alternating with binary pattern '11111' for 1 dB steps 'up'

Set 3: Single Pattern+Alternating with binary pattern '00000' for 1 dB steps 'down'

CETECOM ICT Services is now

After recalling a certain HSUPA sub-test the HSUPA E-AGCH graph with E-TFCI event counter is displayed. After starting with the closed loop command the power is increased in 1 dB steps by activating pattern set 2 until the UE decreases the transmitted E-TFCI.

At this point set 3 is activated once to reduce the output power to the value at which the original E-TFCI, which is required for the sub-test, appears again.

For conducted power measurements the same steps are repeated in the power menu to read out the corresponding maximum RMS output power with the target E-TFCI.

For SAR measurements it is useful to switch to Code Domain Power vs. Time display.

Here the CMU200 shows relative power values (max. and min.) of each code channel which should roughly correspond to the numerators of the gain factors e.g.:

| Sub-te | st β _c | βd | βhs | βec | βed |
|--------|-------------------|----|-----|-----|-----|
| 5 | 15 | 15 | 30 | 24 | 134 |

By this way a surveillance of signalling conditions is possible to make sure that HSUPA code channels are active during the complete SAR measurement.

|----------------------|--|------------------|-----------------------------|----------------------------|--|---|-------------------------------------|--|--|
| Communication system | freq. (MHz) | distance (mm) | P _{avg} * (dBm) | P _{avg} * (mW) | threshold _{1g} comparison value | SAR _{1g} test exclusion thresholds | SAR _{1g} test exclusion | | |
| WLAN 5.2 GHz | 5200 | 5 | 1.0 | 1.3 | 0.6 | 7.5 | yes | | |
| WLAN 5.3 GHz | 5300 | 5 | 1.5 | 1.4 | 0.7 | 7.5 | yes | | |
| WLAN 5.6 GHz | 5600 | 5 | 3.0 | 2.0 | 0.9 | 7.5 | yes | | |
| WLAN 5.8 GHz | 5800 | 5 | 3.5 | 2.2 | 1.1 | 7.5 | yes | | |

Table 25: Standalone SAR test exclusion considerations

Pavg* - maximum possible output power declared by manufacturer

The **10-g SAR test exclusion thresholds** for 100 MHz to 6 GHz at *test separation distances* \leq 50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)]×[$\sqrt{f(GHz)}$] ≤ 3.0 for 1-g SAR and ≤ **7.5** for 10-g extremity SAR, where:

- f(GHz) is the RF channel transmit frequency in GHz
- Power and distance are rounded to the nearest mW and mm before calculation
- The result is rounded to one decimal place for comparison

When the minimum test separation distance is < 5 mm, a distance of 5 mm is applied to determine SAR test exclusion

7.1.3 Standalone SAR Test Exclusion according to RSS-102 Issue 5

| Standa | lone SA | AR test e | exclusio | n consi | derations | |
|----------------------|----------------|------------------|-----------------------------|----------------------------|---|--------------------|
| Communication system | freq. (MHz) | distance (mm) | P _{avg} * (dBm) | P _{avg} * (mW) | Exemption Limits _{1g} (mW) | SAR test exclusion |
| WLAN 5.2 GHz | 5200 | 5 | 1.0 | 1.3 | 2.5 | yes |
| WLAN 5.3 GHz | 5300 | 5 | 1.5 | 1.4 | 2.5 | yes |
| WLAN 5.6 GHz | 5600 | 5 | 3.0 | 2.0 | 2.5 | yes |
| WLAN 5.8 GHz | 5800 | 5 | 3.5 | 2.2 | 2.5 | yes |

Table 26: Standalone SAR test exclusion considerations

P_{avg}* - maximum possible output power declared by manufacturer. Output power level shall be the higher of the maximum conducted or equivalent isotropically radiated power (e.i.r.p.) source-based, time-averaged output power.

For limb-worn devices where the **10g** value applies, the exemption limits for routine evaluation in Table 1 are multiplied by a factor of **2.5**. If the operating frequency of the device is between two frequencies located in Table, linear interpolation shall be applied for the applicable separation distance. For test separation distance less than 5 mm, the exemption limits for a separation distance of 5 mm can be applied to determine if a routine evaluation is required.

advanced

CTC I

7.1.4 SAR measurement positions

| | | SAR m | neasurement p | positions | | |
|--------------|-------|-------|---------------|------------|----------|-------------|
| mode | front | rear | left edge | right edge | top edge | bottom edge |
| GSM 850 | yes | no | yes | yes | yes | yes |
| GSM 1900 | yes | no | yes | yes | yes | yes |
| WCDMA FDD II | yes | no | yes | yes | yes | yes |
| WCDMA FDD V | yes | no | yes | yes | yes | yes |
| WLAN 2450MHz | yes | no | yes | yes | yes | yes |
| WLAN 5GHz | yes | no | yes | yes | yes | yes |
| Bluetooth | yes | no | yes | yes | yes | yes |

The edges with less than 2.5 cm distance to the TX antennas need to be tested for hotspot SAR.

7.2 SAR test results

7.2.1 General description of test procedures

- The DUT is tested using CMU 200 communication tester as controller unit to set test channels and maximum output power to the DUT, as well as for measuring the conducted peak power.
- Test positions as described in the tables above are in accordance with the specified test standard.
- Tests in body position were performed in that configuration, which generates the highest time based averaged output power (see conducted power results).
- UMTS was tested in RMC mode with 12.2 kbit/s and TPC bits set to 'all 1'.
- WLAN was tested in 802.11b mode with 1 MBit/s and 6 MBit/s.
- Required WLAN test channels were selected according to KDB 248227
- According to IEEE 1528 the SAR test shall be performed at middle channel. Testing of top and bottom channel is optional.
- According to KDB 447498 D01 testing of other required channels within the operating mode of a frequency band is not required when the reported 1-g or 10-g SAR for the mid-band or highest output power channel is:
 - ≤ 0.8 W/kg or 2.0 W/kg, for 1-g or 10-g respectively, when the transmission band is ≤ 100 MHz
 - ≤ 0.6 W/kg or 1.5 W/kg, for 1-g or 10-g respectively, when the transmission band is between 100 MHz and 200 MHz
 - ≤ 0.4 W/kg or 1.0 W/kg, for 1-g or 10-g respectively, when the transmission band is ≥ 200 MHz
- IEEE 1528-2013 requires the middle channel to be tested first. This generally applies to wireless devices that are designed to operate in technologies with tight tolerances for maximum output power variations across channels in the band. When the maximum output power variation across the required test channels is > ½ dB, instead of the middle channel, the highest output power channel must be used.

Table 34: SAR_{max} WWAN, BT and WLAN 5GHz, ΣSAR_{10g} evaluation.

Conclusion:

ΣSAR < 4 W/kg, therefore simultaneous transmissions SAR measurement with the enlarged zoom scan measurement and volume scan post-processing procedures is **not** required.

Annex B.6: Bluetooth 2.4GHz

FCC-BT2450 - MSL

Date/Time: 13.03.2017 15:38:46

advanced

DUT: Ingenico; Type: Move/3500; Serial: 161677313191018601103817 Communication System: UID 0, Bluetooth (0); Communication System Band: BT; Frequency: 2480 MHz; Communication System PAR: 1.16 dB; PMF: 1.14288 Medium parameters used: f = 2480 MHz; σ = 2.033 S/m; ϵ_r = 51.515; ρ = 1000 kg/m³ Phantom section: Center Section Measurement Standard: DASY5 DASY5 Configuration: - Probe: ES3DV3 - SN3320; ConvF(4.54, 4.54, 4.54); Calibrated: 12.01.2017; - Sensor-Surface: 3mm (Mechanical Surface Detection (Locations From Previous Scan Used)), Sensor-Surface: 3mm (Mechanical Surface Detection), z = 2.0, 27.0 - Electronics: DAE3 Sn413; Calibrated: 11.01.2017 - Phantom: Triple Flat Phantom 5.1C; Type: QD 000 P51 CA; Serial: 1154 - DASY52 52.8.7(1137); SEMCAD X 14.6.10(7164)

MSL Move3500/Top side position - High/Area Scan (81x141x1): Interpolated grid:

dx=1.500 mm, dy=1.500 mm Maximum value of SAR (interpolated) = 1.89 W/kg

MSL Move3500/Top side position - High/Zoom Scan (5x5x7)/Cube 0:

Measurement grid: dx=7.5mm, dy=7.5mm, dz=5mm Reference Value = 28.385 V/m; Power Drift = -0.05 dB Peak SAR (extrapolated) = 2.53 W/kg SAR(1 g) = 1.19 W/kg; SAR(10 g) = 0.580 W/kg Maximum value of SAR (measured) = 1.51 W/kg

0 dB = 1.51 W/kg = 1.79 dBW/kg

Additional information:

Annex B.7: Liquid depth

Photo 2: Liquid depth 1900 MHz body simulating liquid

Annex C: Photo documentation

Photo documentation is described in the additional document:

Appendix to test report no. 1-2648/16-01-07-A Photo documentation

Annex D: Calibration parameters

Calibration parameters are described in the additional document:

Appendix to test report no. 1-2648/16-01-07-A Calibration data, Phantom certificate and detail information of the DASY5 System

Annex E: RF Technical Brief Cover Sheet acc. to RSS-102 Annex A

- 1. COMPANY NUMBER: 2586D
- 2. PRODUCT MARKETING NAME (PNM): Move/Series

3. HARDWARE VERSION IDENTIFICATION NO. (HVIN): Move/5000 CL/3G/WiFi/BT; Move/3500 CL/3G/WiFi/BT

- 4. FIRMWARE VERSION IDENTIFICATION NO. (FVIN): ---
- 5. HOST MARKETING NAME (HMN): ---
- 6. IC CERTIFICATION NUMBER: 2586D-M50CL3GWIBT
- 7. APPLICANT: Ingenico Group
- 8. SAR/RF EXPOSURE TEST LABORATORY: CTC advanced GmbH
- 9. TYPE OF EVALUATION:
- (a) SAR Evaluation: Device is not Used in the Vicinity of the Human Head

(b) SAR Evaluation: No Body-Worn Device

(c) SAR_{10g} Evaluation: Limb-Worn Device

- Multiple transmitters: Yes ⊠ No □
- ullet Evaluated against exposure limits: General Public Use igtimes Controlled Use igcup
- Duty cycle used in evaluation: 50 %
- Standard used for evaluation:
