Prediction of MPE limit at a given distance

Equation from page 18 of OET Bulletin 65, Edition 97-01

$$S = \frac{PG}{4\pi R^2}$$

where: S = power density
P = power input to the antenna
G = power gain of the antenna in the direction of interest relative to an isotropic radiator
R = distance to the center of radiation of the antenna

Maximum peak output power at antenna input terminal:	46,00	(dBm)
Maximum peak output power at antenna input terminal:	39810,71706	(mW)
Antenna gain(maximum):	11	(dBi)
Maximum antenna gain:	12,58925412	(numeric)
Time Averaging:	100	(%)
Prediction distance:	200	(cm)
Prediction frequency:	2690	(MHz)
MPE limit for uncontrolled exposure at prediction frequency:	1,000	(mW/cm^2)
Power density at prediction frequency:	0,997080	(mW/cm^2)
Margin of compliance:	0,0	(dB)
This equates to:	9,970803206	W/m^2
