

5/27/10

3. ATCB Comments: The device has been subject to Class B (i.e. users manual) and also contains a USB connector which appears to allow data transmission per the schematics. It appears the device may also be subject to PC peripheral requirements (DoC or Certification). However currently this device does not appear to be labeled as such. Please review, explain and/or correct as necessary.

RESPONSE: Per Corventis: "The USB port is not available for the end user and is user only by the manufacturer of the device. During normal operation, the USB port is used to provide power and no data communications is provided."
