# 1 Introduction and Conclusion

The tests indicated in section 2.0 were performed on the product constructed as described in section 4.0. The remaining test sections are the verbatim text from the actual data sheets used during the investigation. These test sections include the test name, the specified test Method, a list of the actual Test Equipment Used, documentation Photos, Results and raw Data. No additions, deviations, or exclusions have been made from the standard(s) unless specifically noted.

Based on the results of our investigation, we have concluded the product tested complies with the requirements of the standard(s) indicated. The results obtained in this test report pertain only to the item(s) tested. Intertek does not make any claims of compliance for samples or variants which were not tested.

# 2 Test Summary

#### Description of Equipment Under Test

The equipment under test (EUT) is a Z-Wave Plus single gang Decora wireless light switch operating at 908.4-908.42 MHz and/or 916.00 MHz. The EUT is battery powered and uses an integral antenna.

| Equipment Under Test Power Configuration                     |     |     |     |  |

### 5.1 Method:

Configuration as required by ANSI C63.10-2013.

# 5.2 EUT Block Diagram:

EUT

# 6 Fundamental Field Strength

## 6.1 **Performance Requirement(s)**

The field strength of emissions, measured at 3 meters, from intentional radiators operated within the frequency band shall comply with the following:

| Fundamental frequency | Field strength of fundamental<br>(millivolts/meter) | Field strength of harmonics<br>(microvolts/meter) |
|-----------------------|---|---|
| 902-928 MHz           | 50  | 500   |

## 6.2 Method

Tests are performed in accordance with ANSI C63.10-2013.

The EUT was placed on a non-conducting table 80 cm (below 1 GHz) or 1.5 meters (above 1 GHz) above the ground plane (turntable). The antenna to EUT distance was 3 meters.

The transmitter configured to transmit continuously. The turntable containing the EUT was rotated through 360 degrees and the receive antenna height was varied from 1 to 4 meters to locate the worst-case emissions levels. Measurements were made with the antenna in both the horizontal and vertical polarizations. EUT was tested at horizontal and vertical orientations, the possible orientations used by the end users. The worst-case data is recorded in this report.

New batteries were used during measurement.

#### TEST SITE:

The test is performed in the 3 meter semi-anechoic chamber located at 25791 Commercentre Drive, Lake Forest, California 92630 USA. This test facility meets the requirements of CISPR 16-1-4 and has been accredited by A2LA.

#### **Measurement Uncertainty**

| Measurement            | Frequency<br>Range | Expanded<br>Uncertainty<br>(k=2) | Ucispr |
|------------------------|--------------------|----------------------------------|--------|
| Radiated Emissions, 3m | 30-1000 MHz        | 4.2                              | 6.3 dB |

As shown in the table above our radiated emissions  $U_{lab}$  is less than the corresponding  $U_{CISPR}$  reference value in CISPR 16-4-2 Table 1, hence the compliance of the product is only based on the measured value, and no measurement uncertainty correction is required.

# Sample Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

 $\begin{array}{ll} FS = RA + AF + CF - AG \\ Where & FS = Field Strength in dB\mu V/m \\ RA = Receiver Amplitude (including preamplifier) in dB\mu V \\ CF = Cable Attenuation Factor in dB \\ AF = Antenna Factor in dB \\ AG = Amplifier Gain in dB \end{array}$ 

In the following table(s), the reading shown on the data table reflects the preamplifier gain. An example for the calculations in the following table is as follows.

Assume a receiver reading of 52.0 dB $\mu$ V is obtained. The antenna factor of 7.4 dB and cable factor of 1.6 dB is added. The amplifier gain of 29 dB is subtracted, giving a field strength of 32 dB $\mu$ V/m. This value in dB $\mu$ V/m was converted to its corresponding level in  $\mu$ V/m.

 $\label{eq:result} \begin{array}{l} {\sf RA} = 52.0 \ d{\sf B}\mu{\sf V} \\ {\sf AF} = \ 7.4 \ d{\sf B}/{\sf m} \\ {\sf CF} = \ 1.6 \ d{\sf B} \\ {\sf AG} = 29.0 \ d{\sf B} \\ {\sf FS} = 32 \ d{\sf B}\mu{\sf V}/{\sf m} \end{array}$ 

To convert from  $dB\mu V$  to  $\mu V$  or mV the following was used:

 $UF = 10^{(NF / 20)} \text{ where } UF = Net \text{ Reading in } \mu V$   $NF = Net \text{ Reading in } dB \mu V$ 

# Example:

FS = RA + AF + CF - AG = 52.0 + 7.4 + 1.6 - 29.0 = 32.0 $UF = 10^{(32 \ dB_{\mu}V \ / \ 20)} = 39.8 \ \mu V/m$

Deviations, Additions, or Exclusions: None

# 7 Occupied Bandwidth

## 7.1 Performance Requirement(s)

Intentional radiators must be designed to ensure that the 20 dB bandwidth of the emission is contained within the frequency band designated in the rule section under which the equipment is operated. (FCC §15.215(c))

The transmitted signal bandwidth shall be reported as the 99% emission bandwidth, as calculated or measured. (ISED RSS-Gen Issue 4 §6.6)

## 7.2 Method

Tests are performed in accordance with ANSI C63.10-2013.

#### TEST SITE:

The test is performed in the 3 meter semi-anechoic chamber located at 25791 Commercentre Drive, Lake Forest, California 92630 USA. This test facility meets the requirements of CISPR 16-1-4 and has been accredited by A2LA.

#### Measurement Uncertainty

| Measurement            | Frequency<br>Range | Expanded<br>Uncertainty<br>(k=2) | Ucispr |
|------------------------|--------------------|----------------------------------|--------|
| Radiated Emissions, 3m | 30-1000 MHz        | 4.2                              | 6.3 dB |

As shown in the table above our radiated emissions  $U_{lab}$  is less than the corresponding  $U_{CISPR}$  reference value in CISPR 16-4-2 Table 1, hence the compliance of the product is only based on the measured value, and no measurement uncertainty correction is required.

# 7.3 **Test Equipment Used:**

| Asset | Description                 | Manufacturer | Model     | Serial     | Cal Date       | Cal Due        |

# 8 Transmitter Radiated Emissions

# 8.1 Performance Requirement(s)

The field strength of emissions from intentional radiators operated within the frequency band shall comply with the following:

| Fundamental frequency | Field strength of fundamental<br>(millivolts/meter) | Field strength of harmonics<br>(microvolts/meter) |
|-----------------------|---|---|
| 902-928 MHz           | 50  | 500   |

Field strength limits are specified at a distance of 3 meters. Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in FCC § 15.209 and IC RSS-Gen, whichever is the lesser attenuation. The peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any condition of modulation.

Radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

## 8.2 Method

Tests are performed according to the procedures in ANSI C63.10-2013.

The EUT was placed on a non-conducting table 80 cm (below 1 GHz) or 1.5 meters (above 1 GHz) above the ground plane (turntable). Radiated test was performed at an antenna to EUT distance of 3 meters.

The spectrum from 30 MHz to the 10<sup>th</sup> harmonic was investigated with the transmitter configured to continuously transmit. The turntable containing the EUT was rotated through 360 degrees and the receive antenna height was varied from 1 to 4 meters to locate the worst-case emissions levels. Measurements were made with the antenna in both the horizontal and vertical polarizations. EUT was tested at horizontal and vertical orientations, the possible orientations used by the end users. The worst-case data is recorded in this report.

New batteries were used during measurement.

#### TEST SITE:

The test is performed in the 3 meter semi-anechoic chamber located at 25791 Commercentre Drive, Lake Forest, California 92630 USA. This test facility meets the requirements of CISPR 16-1-4 and has been accredited by A2LA.

#### Measurement Uncertainty

| Measurement            | Frequency Range | Expanded<br>Uncertainty (k=2) | Ucispr |
|------------------------|-----------------|-------------------------------|--------|
| Radiated Emissions, 3m | 30-1000 MHz     | 4.2                           | 6.3 dB |
| Radiated Emissions, 3m | 1-10 GHz        | 4.4                           | 5.2 dB |

As shown in the table above our radiated emissions  $U_{lab}$  is less than the corresponding  $U_{CISPR}$  reference value in CISPR 16-4-2 Table 1, hence the compliance of the product is only based on the measured value, and no measurement uncertainty correction is required.

# Sample Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

 $\begin{array}{ll} FS = RA + AF + CF - AG \\ Where & FS = Field \ Strength \ in \ dB\mu V/m \\ RA = Receiver \ Amplitude \ (including \ preamplifier) \ in \ dB\mu V \\ CF = Cable \ Attenuation \ Factor \ in \ dB \\ AF = Antenna \ Factor \ in \ dB \\ AG = Amplifier \ Gain \ in \ dB \end{array}$ 

In the following table(s), the reading shown on the data table reflects the preamplifier gain. An example for the calculations in the following table is as follows.

Assume a receiver reading of 52.0 dB $\mu$ V is obtained. The antenna factor of 7.4 dB and cable factor of 1.6 dB is added. The amplifier gain of 29 dB is subtracted, giving a field strength of 32 dB $\mu$ V/m. This value in dB $\mu$ V/m was converted to its corresponding level in  $\mu$ V/m.

 $\label{eq:result} \begin{array}{l} {\sf RA} = 52.0 \ d{\sf B}\mu{\sf V} \\ {\sf AF} = \ 7.4 \ d{\sf B}/{\sf m} \\ {\sf CF} = \ 1.6 \ d{\sf B} \\ {\sf AG} = 29.0 \ d{\sf B} \\ {\sf FS} = 32 \ d{\sf B}\mu{\sf V}/{\sf m} \end{array}$ 

To convert from  $dB\mu V$  to  $\mu V$  or mV the following was used:

 $UF = 10^{(NF / 20)} \text{ where } UF = Net \text{ Reading in } \mu V$   $NF = Net \text{ Reading in } dB \mu V$ 

# Example:

FS = RA + AF + CF - AG = 52.0 + 7.4 + 1.6 - 29.0 = 32.0 $UF = 10^{(32 \ dB_{\mu}V \ / \ 20)} = 39.8 \ \mu V/m$

# 9 Radiated Emissions

## 9.1 Performance Requirement(s)

Limits for Electromagnetic Radiated Emissions FCC Section 15.109(b), ICES-003\*, RSS-Gen

| Frequency | Class A at 10m | Class B at 3m |
|-----------|----------------|---------------|
| (MHz)     | dB(uV/m)       | dB(uV/m)      |
| 30-88     | 39.0           | 40.0          |
| 88-216    | 43.5           | 43.5          |
| 216-960   | 46.4           | 46.0          |
| Above 960 | 49.5           | 54.0          |

\*According to FCC Part 15.109(g) an alternative to the radiated emission limits shown above, digital devices may be shown to comply with the limit of CISPR Pub.22

## 9.2 Method

Tests are performed in accordance with ANSI C63.4-2014.

The EUT was placed on a non-conducting table 80 cm above the ground plane (turntable). The antenna to EUT distance was 3 meters.

The spectrum from 30 MHz to the 5<sup>th</sup> harmonic was investigated with the EUT configured to normal operation. The turntable containing the EUT was rotated through 360 degrees and the receive antenna height was varied from 1 to 4 meters to locate the worst-case emissions levels. Measurements were made with the antenna in both the horizontal and vertical polarizations. EUT was tested at horizontal and vertical orientations, the possible orientations used by the end users. The worst-case data is recorded in this report.

New batteries were used during measurement.

#### TEST SITE:

The test is performed in the 3 meter semi-anechoic chamber located at 25791 Commercentre Drive, Lake Forest, California 92630 USA. This test facility meets the requirements of CISPR 16-1-4 and has been accredited by A2LA.

#### Measurement Uncertainty

| Measurement            | Frequency Range | Expanded<br>Uncertainty (k=2) | Ucispr |
|------------------------|-----------------|-------------------------------|--------|
| Radiated Emissions, 3m | 30-1000 MHz     | 4.2                           | 6.3 dB |
| Radiated Emissions, 3m | 1-10 GHz        | 4.4                           | 5.2 dB |

As shown in the table above our radiated emissions  $U_{lab}$  is less than the corresponding  $U_{CISPR}$  reference value in CISPR 16-4-2 Table 1, hence the compliance of the product is only based on the measured value, and no measurement uncertainty correction is required.

# Sample Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

 $\begin{array}{ll} FS = RA + AF + CF - AG \\ Where & FS = Field Strength in dB\mu V/m \\ RA = Receiver Amplitude (including preamplifier) in dB\mu V \\ CF = Cable Attenuation Factor in dB \\ AF = Antenna Factor in dB \\ AG = Amplifier Gain in dB \end{array}$ 

In the following table(s), the reading shown on the data table reflects the preamplifier gain. An example for the calculations in the following table is as follows.

Assume a receiver reading of 52.0 dB $\mu$ V is obtained. The antenna factor of 7.4 dB and cable factor of 1.6 dB is added. The amplifier gain of 29 dB is subtracted, giving a field strength of 32 dB $\mu$ V/m. This value in dB $\mu$ V/m was converted to its corresponding level in  $\mu$ V/m.

$$\label{eq:RA} \begin{split} &{\sf RA} = 52.0 \ d{\sf B}\mu{\sf V} \\ &{\sf AF} = \ 7.4 \ d{\sf B}/{\sf m} \\ &{\sf CF} = \ 1.6 \ d{\sf B} \\ &{\sf AG} = 29.0 \ d{\sf B} \\ &{\sf FS} = 32 \ d{\sf B}\mu{\sf V}/{\sf m} \end{split}$$

To convert from  $dB\mu V$  to  $\mu V$  or mV the following was used:

 $UF = 10^{(NF/20)}$  where UF = Net Reading in  $\mu V$ NF = Net Reading in  $dB\mu V$ 

#### Example:

 $\begin{array}{l} FS = RA + AF + CF - AG = 52.0 + 7.4 + 1.6 - 29.0 = 32.0 \\ UF = 10^{(32 \ dB_{\mu}V \ / \ 20)} = 39.8 \ \mu V/m \end{array}$

## **10 AC Mains Conducted Emissions**

## 10.1 Method

Tests are performed in accordance with ANSI C63.4.

#### TEST SITE:

The test is performed in the 3 meter semi-anechoic chamber located at 25791 Commercentre Drive, Lake Forest, California 92630 USA. This test facility meets the requirements of CISPR 16-1-4 and has been accredited by A2LA.

#### Measurement Uncertainty

| Measurement                 | Frequency Range  | Expanded<br>Uncertainty (k=2) | Ucispr |
|-----------------------------|------------------|-------------------------------|--------|
| AC Line Conducted Emissions | 150 kHz - 30 MHz | 2.1 dB                        | 3.4dB  |
| Telco Port Emissions        | 150 kHz - 30 MHz | 2.6 dB                        | 5.0dB  |

As shown in the table above our conducted emissions  $U_{lab}$  is less than the corresponding  $U_{CISPR}$  reference value in CISPR 16-4-2 Table 1, hence the compliance of the product is only based on the measured value, and no measurement uncertainty correction is required.

#### Sample Calculations

The following is how net line-conducted readings were determined:

NF = RF + LF + CF + AF

Where NF = Net Reading in  $dB\mu V$ 

RF = Reading from receiver in  $dB\mu V$ 

LF = LISN or ISN Correction Factor in dB

- CF = Cable Correction Factor in dB
- AF = Attenuator Loss Factor in dB

To convert from  $dB\mu V$  to  $\mu V$  or mV the following was used:

 $UF = 10^{(NF/20)}$  where UF = Net Reading in  $\mu V$ NF = Net Reading in  $dB\mu V$ 

#### Example:

 $\begin{array}{l} \mathsf{NF} = \mathsf{RF} + \mathsf{LF} + \mathsf{CF} + \mathsf{AF} = 28.5 + 0.2 + 0.4 + 20.0 = 49.1 \ dB\mu \mathsf{V} \\ \mathsf{UF} = 10^{(49.1 \ dB\mu \mathsf{V} \,/ \, 20)} = 285.1 \ \mu \mathsf{V/m} \end{array}$ 

# 10.2 **Test Equipment Used:**

| Asset | Description | Manufacturer | Model | Serial | Cal Date | Cal Due |
|-------|-------------|--------------|-------|--------|----------|---------|
| N/A   | N/A         | N/A          | N/A   | N/A    | N/A      | N/A     |

#### Software Utilized:

| Name | Manufacturer | Version | Profile |  |
|------|--------------|---------|---------|--|
| N/A  | N/A          | N/A     | N/A     |  |

## 10.3 Results:

This test is not applicable as the EUT is battery powered.
