

# EMC TEST REPORT

**Report Number:** 102222322LAX-001  
**Project Number:** G102222322

**Report Issue Date:** October 18, 2015

**Model(s) Tested:** DW-ZWAVE2.5-ECO

**Standards: FCC CFR47 Part 15 Subpart C, October 2014**  
Intentional Radiator  
§15.249, Operation within the bands 902-928 MHz, 2400-2483.5 MHz, 5725-5875 MHz, and 24.0-24.25 GHz

**FCC CFR47 Part 15 Subpart B, October 2014**  
Unintentional Radiator

**Industry Canada RSS-210 Issue 8, December 2010**  
License-exempt Radio Apparatus (All Frequency Bands): Category I Equipment  
§A2.9, Bands 902-928 MHz, 2400-2483.5 MHz, 5725-5875 MHz

**Industry Canada ICES-003 Issue 5**  
Information Technology Equipment (ITE) - Limits and methods of measurement

**Tested by:**  
Intertek  
25791 Commercentre Drive  
Lake Forest, CA 92630  
USA

**Client:**  
Ecolink

## 1 Introduction and Conclusion

The tests indicated in section 2.0 were performed on the product constructed as described in section 4.0. The remaining test sections are the verbatim text from the actual data sheets used during the investigation. These test sections include the test name, the specified test Method, a list of the actual Test Equipment Used, documentation Photos, Results and raw Data. No additions, deviations, or exclusions have been made from the standard(s) unless specifically noted.

Based on the results of our investigation, we have concluded the product tested does not comply with the requirements of the standard(s) indicated. The results obtained in this test report pertain only to the item(s) tested. Intertek does not make any claims of compliance for samples or variants which were not tested.

## 2 Test Summary

Section	Test full name	Result
6	Fundamental Field Strength (FCC §15.249(a), FCC §15.249(c); IC RSS-210 Issue 8 §A2.9)	Compliant
7	Occupied Bandwidth (FCC §15.215; IC RSS-Gen Issue 4 §6.6)	Compliant
8	Transmitter Radiated Spurious Emissions (FCC §15.249(a), FCC §15.249(c), FCC §15.249(d), FCC §15.209; IC RSS-210 Issue 8 §A2.9, IC RSS-Gen Issue 4 §8.9)	Compliant
9	Receiver Radiated Spurious Emissions (FCC §15.109; IC ICES-003 Issue 5 §6.2)	Compliant
10	AC Mains Conducted Emissions (FCC §15.207; IC RSS-Gen Issue 4 §8.8) (FCC §15.107; IC ICES-003 Issue 5 §6.1)	N/A*

\*: EUT is battery powered

### 3 Client Information

This EUT was tested at the request of:

**Client:** Ecolink

### 4 Description of Equipment Under Test and Variant Models

Equipment Under Test			
Description	Manufacturer	Model Number	Serial Number
Home Motion Sensor	Ecolink	DW-ZWAVE2.5-ECO	908.42 MHz
Home Motion Sensor	Ecolink	DW-ZWAVE2.5-ECO	916.00 MHz
Home Motion Sensor	Ecolink	DW-ZWAVE2.5-ECO	Production Firmware

Receive Date:	07/30/2015, 09/16/2015
Received Condition:	Good
Type:	Production

#### Description of Equipment Under Test

The equipment under test (EUT) is a door and window sensor operating at 908.42 MHz and/or 916.00 MHz. The EUT is battery powered and uses an integral antenna.

Equipment Under Test Power Configuration			
Rated Voltage	Rated Current	Rated Frequency	Number of Phases
3VDC	N/A	N/A	N/A

#### Operating modes of the EUT:

No.	Descriptions of EUT Exercising
1	908.42 MHz, 9.6 kbps data rate, FSK Modulation
2	916.00 MHz, 100 kbps data rate, GFSK Modulation
3	Production Firmware

#### Software used by the EUT:

No.	Descriptions of EUT Exercising
1	Modes 1 and 2 were programmed to transmit continuously during testing. Mode 3 was configured as normal operation.

<b>Radio/Receiver Characteristics</b>	
<b>Frequency Band(s)</b>	908.4 MHz, 908.42 MHz; 916.00 MHz
<b>Modulation Type(s)</b>	FSK; GFSK
<b>Test Channels</b>	908.42 MHz, 916.00 MHz
<b>Equipment Type</b>	Standalone

**5.2 EUT Block Diagram:**

## 6 Fundamental Field Strength

### 6.1 Performance Criterion

The field strength of emissions, measured at 3 meters, from intentional radiators operated within the frequency band shall comply with the following:

Fundamental frequency	Field strength of fundamental (millivolts/meter)	Field strength of harmonics (microvolts/meter)
902-928 MHz	50	500

### 6.2 Method

Tests are performed in accordance with ANSI C63.10-2013.

The EUT was placed on a non-conducting table 80 cm (below 1 GHz) or 1.5 meters (above 1 GHz) above the ground plane (turntable). The antenna to EUT distance was 3 meters.

The transmitter configured to transmit continuously. The turntable containing the EUT was rotated through 360 degrees and the receive antenna height was varied from 1 to 4 meters to locate the worst-case emissions levels. Measurements were made with the antenna in both the horizontal and vertical polarizations. EUT was tested at three orthogonal planes. The worst-case data is recorded in this report.

#### TEST SITE:

The test is performed in the 3 meter semi-anechoic chamber located at 25791 Commercentre Drive, Lake Forest, California 92630 USA. This test facility meets the requirements of CISPR 16-1-4 and has been accredited by A2LA.

#### Measurement Uncertainty

Measurement	Frequency Range	Expanded Uncertainty (k=2)	U <sub>CISPR</sub>
Radiated Emissions, 3m	30-1000 MHz	4.2	6.3 dB

As shown in the table above our radiated emissions  $U_{lab}$  is less than the corresponding  $U_{CISPR}$  reference value in CISPR 16-4-2 Table 1, hence the compliance of the product is only based on the measured value, and no measurement uncertainty correction is required.

**Sample Calculation**

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

$$FS = RA + AF + CF - AG$$

Where

- FS = Field Strength in dB $\mu$ V/m
- RA = Receiver Amplitude (including preamplifier) in dB $\mu$ V
- CF = Cable Attenuation Factor in dB
- AF = Antenna Factor in dB
- AG = Amplifier Gain in dB

In the following table(s), the reading shown on the data table reflects the preamplifier gain. An example for the calculations in the following table is as follows.

Assume a receiver reading of 52.0 dB $\mu$ V is obtained. The antenna factor of 7.4 dB and cable factor of 1.6 dB is added. The amplifier gain of 29 dB is subtracted, giving a field strength of 32 dB $\mu$ V/m. This value in dB $\mu$ V/m was converted to its corresponding level in  $\mu$ V/m.

RA = 52.0 dB $\mu$ V  
 AF = 7.4 dB/m  
 CF = 1.6 dB  
 AG = 29.0 dB  
 FS = 32 dB $\mu$ V/m

To convert from dB $\mu$ V to  $\mu$ V or mV the following was used:

$$UF = 10^{(NF / 20)} \text{ where } UF = \text{Net Reading in } \mu\text{V}$$

$$NF = \text{Net Reading in dB}\mu\text{V}$$

**Example:**

$$FS = RA + AF + CF - AG = 52.0 + 7.4 + 1.6 - 29.0 = 32.0$$

$$UF = 10^{(32 \text{ dB}\mu\text{V} / 20)} = 39.8 \mu\text{V/m}$$

**6.3 Test Equipment Used:**

Asset	Description	Manufacturer	Model	Serial	Cal Date	Cal Due

Deviations, Additions, or Exclusions: None

## 7 Occupied Bandwidth

### 7.1 Performance Criterion

Intentional radiators must be designed to ensure that the 20 dB bandwidth of the emission is contained within the frequency band designated in the rule section under which the equipment is operated. (FCC §15.215(c))

The transmitted signal bandwidth shall be reported as the 99% emission bandwidth, as calculated or measured. (IC RSS-Gen Issue 4 §6.6)

### 7.2 Method

Tests are performed in accordance with ANSI C63.10-2013.

#### TEST SITE:

The test is performed in the 3 meter semi-anechoic chamber located at 25791 Commercentre Drive, Lake Forest, California 92630 USA. This test facility meets the requirements of CISPR 16-1-4 and has been accredited by A2LA.

#### Measurement Uncertainty

Measurement	Frequency Range	Expanded Uncertainty (k=2)	U <sub>CISPR</sub>
Radiated Emissions, 3m	30-1000 MHz	4.2	6.3 dB

As shown in the table above our radiated emissions  $U_{lab}$  is less than the corresponding  $U_{CISPR}$  reference value in CISPR 16-4-2 Table 1, hence the compliance of the product is only based on the measured value, and no measurement uncertainty correction is required.

**7.3 Test Equipment Used:**

Asset	Description	Manufacturer	Model	Serial	Cal Date	Cal Due
1140	EMI Test Receiver	Rohde & Schwarz	ESC17	100825	02/04/2015	02/04/2016

Deviations, Additions, or Exclusions: None

## 8 Transmitter Radiated Spurious Emissions

### 8.1 Performance Criterion

The field strength of emissions from intentional radiators operated within the frequency band shall comply with the following:

Fundamental frequency	Field strength of fundamental (millivolts/meter)	Field strength of harmonics (microvolts/meter)
902-928 MHz	50	500

Field strength limits are specified at a distance of 3 meters. Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in FCC § 15.209 and IC RSS-Gen, whichever is the lesser attenuation. The peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any condition of modulation.

### 8.2 Method

Tests are performed in accordance with ANSI C63.10-2013.

The EUT was placed on a non-conducting table 80 cm (below 1 GHz) or 1.5 meters (above 1 GHz) above the ground plane (turntable). The antenna to EUT distance was 3 meters.

The spectrum from 30 MHz to the 10<sup>th</sup> harmonic was investigated with the transmitter configured to continuously transmit. The turntable containing the EUT was rotated through 360 degrees and the receive antenna height was varied from 1 to 4 meters to locate the worst-case emissions levels. Measurements were made with the antenna in both the horizontal and vertical polarizations. EUT was tested at three orthogonal planes. The worst-case data is recorded in this report.

#### TEST SITE:

The test is performed in the 3 meter semi-anechoic chamber located at 25791 Commercentre Drive, Lake Forest, California 92630 USA. This test facility meets the requirements of CISPR 16-1-4 and has been accredited by A2LA.

#### Measurement Uncertainty

Measurement	Frequency Range	Expanded Uncertainty (k=2)	U <sub>CISPR</sub>
Radiated Emissions, 3m	30-1000 MHz	4.2	6.3 dB
Radiated Emissions, 3m	1-10 GHz	4.4	5.2 dB

As shown in the table above our radiated emissions  $U_{lab}$  is less than the corresponding  $U_{CISPR}$  reference value in CISPR 16-4-2 Table 1, hence the compliance of the product is only based on the measured value, and no measurement uncertainty correction is required.

**Sample Calculation**

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

$$FS = RA + AF + CF - AG$$

Where

- FS = Field Strength in dB $\mu$ V/m
- RA = Receiver Amplitude (including preamplifier) in dB $\mu$ V
- CF = Cable Attenuation Factor in dB
- AF = Antenna Factor in dB
- AG = Amplifier Gain in dB

In the following table(s), the reading shown on the data table reflects the preamplifier gain. An example for the calculations in the following table is as follows.

Assume a receiver reading of 52.0 dB $\mu$ V is obtained. The antenna factor of 7.4 dB and cable factor of 1.6 dB is added. The amplifier gain of 29 dB is subtracted, giving a field strength of 32 dB $\mu$ V/m. This value in dB $\mu$ V/m was converted to its corresponding level in  $\mu$ V/m.

RA = 52.0 dB $\mu$ V  
 AF = 7.4 dB/m  
 CF = 1.6 dB  
 AG = 29.0 dB  
 FS = 32 dB $\mu$ V/m

To convert from dB $\mu$ V to  $\mu$ V or mV the following was used:

$$UF = 10^{(NF / 20)} \text{ where } UF = \text{Net Reading in } \mu\text{V}$$

$$NF = \text{Net Reading in dB}\mu\text{V}$$

**Example:**

$$FS = RA + AF + CF - AG = 52.0 + 7.4 + 1.6 - 29.0 = 32.0$$

$$UF = 10^{(32 \text{ dB}\mu\text{V} / 20)} = 39.8 \mu\text{V/m}$$

### Duty Cycle Correction Factor Calculation

$$20 \text{ LOG } (44.4/100) = -7.05 \text{ dB}$$

## 9 Receiver Radiated Spurious Emissions

### 9.1 Method

Tests are performed in accordance with ANSI C63.4-2014.

The EUT was placed on a non-conducting table 80 cm above the ground plane (turntable). The antenna to EUT distance was 3 meters.

The spectrum from 30 MHz to the 5<sup>th</sup> harmonic was investigated with the EUT configured to normal operation. The turntable containing the EUT was rotated through 360 degrees and the receive antenna height was varied from 1 to 4 meters to locate the worst-case emissions levels. Measurements were made with the antenna in both the horizontal and vertical polarizations. EUT was tested at three orthogonal planes. The worst-case data is recorded in this report.

#### TEST SITE:

The test is performed in the 3 meter semi-anechoic chamber located at 25791 Commercentre Drive, Lake Forest, California 92630 USA. This test facility meets the requirements of CISPR 16-1-4 and has been accredited by A2LA.

#### Measurement Uncertainty

Measurement	Frequency Range	Expanded Uncertainty (k=2)	U <sub>CISPR</sub>
Radiated Emissions, 3m	30-1000 MHz	4.2	6.3 dB
Radiated Emissions, 3m	1-10 GHz	4.4	5.2 dB

As shown in the table above our radiated emissions  $U_{lab}$  is less than the corresponding  $U_{CISPR}$  reference value in CISPR 16-4-2 Table 1, hence the compliance of the product is only based on the measured value, and no measurement uncertainty correction is required.

#### Sample Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

$$FS = RA + AF + CF - AG$$

Where

FS = Field Strength in dB $\mu$ V/m

RA = Receiver Amplitude (including preamplifier) in dB $\mu$ V

CF = Cable Attenuation Factor in dB

AF = Antenna Factor in dB

AG = Amplifier Gain in dB

In the following table(s), the reading shown on the data table reflects the preamplifier gain. An example for the calculations in the following table is as follows.

Assume a receiver reading of 52.0 dB $\mu$ V is obtained. The antenna factor of 7.4 dB and cable factor of 1.6 dB is added. The amplifier gain of 29 dB is subtracted, giving a field strength of 32 dB $\mu$ V/m. This value in dB $\mu$ V/m was converted to its corresponding level in  $\mu$ V/m.

$$RA = 52.0 \text{ dB}\mu\text{V}$$

$$AF = 7.4 \text{ dB/m}$$

CF = 1.6 dB  
 AG = 29.0 dB  
 FS = 32 dBμV/m

To convert from dBμV to μV or mV the following was used:

$$UF = 10^{(NF / 20)} \text{ where UF = Net Reading in } \mu\text{V}$$

$$NF = \text{Net Reading in dB}\mu\text{V}$$

**Example:**

$$FS = RA + AF + CF - AG = 52.0 + 7.4 + 1.6 - 29.0 = 32.0$$

$$UF = 10^{(32 \text{ dB}\mu\text{V} / 20)} = 39.8 \mu\text{V/m}$$

**9.2 Test Equipment Used:**

 Atmospheric Pressure: 987.4 mbars, 987.7 mbars

Deviations, Additions, or Exclusions: None

## 10 AC Mains Conducted Emissions

### 10.1 Method

Tests are performed in accordance with ANSI C63.4.

#### TEST SITE:

The test is performed in the 3 meter semi-anechoic chamber located at 25791 Commercentre Drive, Lake Forest, California 92630 USA. This test facility meets the requirements of CISPR 16-1-4 and has been accredited by A2LA.

#### Measurement Uncertainty

Measurement	Frequency Range	Expanded Uncertainty (k=2)	Ucisprr
AC Line Conducted Emissions	150 kHz - 30 MHz	2.1 dB	3.4dB
Telco Port Emissions	150 kHz - 30 MHz	2.6 dB	5.0dB

As shown in the table above our conducted emissions  $U_{lab}$  is less than the corresponding  $U_{CISPR}$  reference value in CISPR 16-4-2 Table 1, hence the compliance of the product is only based on the measured value, and no measurement uncertainty correction is required.

#### Sample Calculations

The following is how net line-conducted readings were determined:

$$NF = RF + LF + CF + AF$$

Where NF = Net Reading in dB $\mu$ V

RF = Reading from receiver in dB $\mu$ V

LF = LISN or ISN Correction Factor in dB

CF = Cable Correction Factor in dB

AF = Attenuator Loss Factor in dB

To convert from dB $\mu$ V to  $\mu$ V or mV the following was used:

$$UF = 10^{(NF / 20)} \text{ where } UF = \text{Net Reading in } \mu\text{V}$$

$$NF = \text{Net Reading in dB}\mu\text{V}$$

#### Example:

$$NF = RF + LF + CF + AF = 28.5 + 0.2 + 0.4 + 20.0 = 49.1 \text{ dB}\mu\text{V}$$

$$UF = 10^{(49.1 \text{ dB}\mu\text{V} / 20)} = 285.1 \mu\text{V/m}$$

**10.2 Test Equipment Used:**

<b>Asset</b>	<b>Description</b>	<b>Manufacturer</b>	<b>Model</b>	<b>Serial</b>	<b>Cal Date</b>	<b>Cal Due</b>
N/A	N/A	N/A	N/A	N/A	N/A	N/A

**Software Utilized:**

<b>Name</b>	<b>Manufacturer</b>	<b>Version</b>	<b>Profile</b>
N/A	N/A	N/A	N/A

**10.3 Results:**

This test is not applicable as the EUT is battery powered.
