Test Location:	Bureau Veritas Consumer Products Services Germany GmbH European Compliance Laboratory (ECL) Thurn-und-Taxis-Straße 18 D-90411 Nürnberg Tel.: +49 40 74041 0 Fax: +49 40 74041-2755

General:
The purpose of this report is to show compliance to the FCC regulations for licensed devices operating under section 90 of the Code of Federal Regulations title 47.
This report informs about the results of the RF tests, it only refers to the equipment under test. No part of this report may be reproduced in any form, without written permission.

Table of contents

1 Test Results Summary

Name of Test	FCC Para. No.	FCC Method	FCC Spec.	Result
RF Power Output	90.635	2.1046	1000 Watts	Complies
Occupied Bandwidth	90.210	2.1049	Input/Output	Complies
Spurious Emissions at Antenna Terminals	90.543	2.1051	-13dBm	Complies
Radiated Spurious emission	90.543	2.1053	-25dBm	Complies
Frequency Stability	90.539	2.1055	1 ppm	NA
Out of Band Rejection	KDB 935210 D02 v02	KDB 935210 D02 v02	KDB 935210 D02 v02	Complies
Noise floor	KDB 935210 D02 v02	KDB 935210 D02 v02	KDB 935210 D02 v02	Complies

Frequency stability is given by: The system gets an electrical analog signal from the BSS which is converted into an analog optical signal, transmitted by the optical links and then reconverted in the Remote Unit into an analog electrical signal. During this process happens no frequency change/modification, so input and output have same frequency what can be seen under capture “Occupied Bandwith”.

2 Equipment under test (E.U.T.)

2.1 Description

Kind of equipment	TFAH-ES70/80/50
Andrew ID-Nr.	Id. No. TFAH-ES70/80/50
Serial no.(SN)	10
Revision	00
Software version and ID	n. a.
Type of modulation and Designator	F3E (Voice) ☒ C4FM (D7W) ☒ H-DQPSK (D1W) ☒
Frequency Translation	F1-F1 ☒ F1-F2 ☐ N/A ☐
Band Selection	Software ☐ Duplexer ☒ Full band ☐

2.1.1 Downlink

Full pass band	758 MHz – 775 MHz
Pass band under test	769 MHz – 775 MHz
Max. composite output power based on one carrier (rated)	31 dBm = 1.26 W
Gain*	32 dB

*see 2.1.5

2.1.2 Uplink

Pass band	n. a.
Gain*	n. a.

*see 2.1.5

Note: The EUT does not transmit over the air in the uplink direction.

2.1.3 Description of EUT

TFAH-ES70/80/50 is a multi-band, multi-operator remote unit configuration used in conjunction with a master unit in the ION optical distribution system. This system transports up to three frequency bands simultaneously (500 MHz, 700 MHz, and 800MHz), providing a cost-effective solution for distributing capacity from one or more base stations.

This Test Report describes only the approval of the 700 MHz path (769 – 775 MHz)

2.1.4 Block diagram of measurement reference points

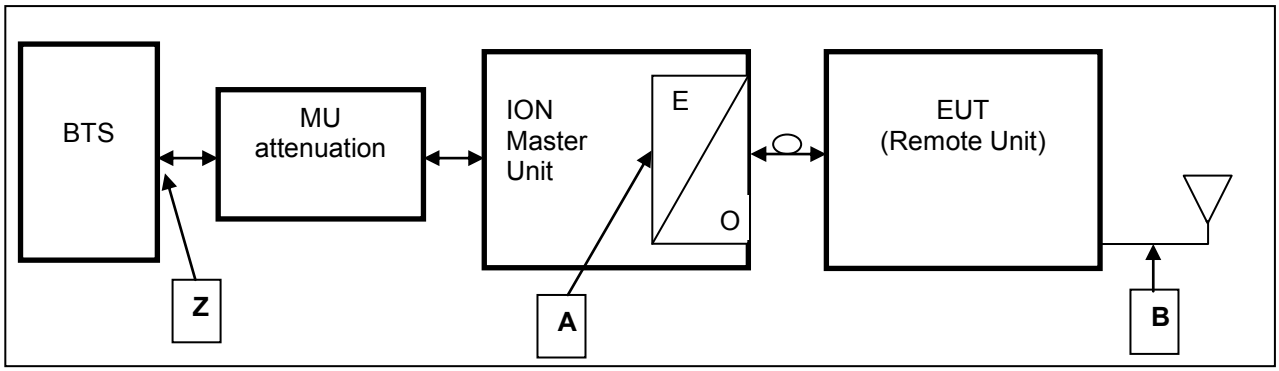

figure 2.1.4-#1 Block diagram of measurement reference points

Remote Unit is the EUT

O/E	Optical / Electrical converter
SRMU	Sub Rack Master Unit

Reference point A	SRMU	UL output,	DL input
Reference point B	Remote Unit	DL output,	UL input
Reference point Z	BTS	DL output,	UL input

Downlink: Measure from reference point B to A

Since a signal generator does not supply a good output signal with +33 or +43dBm, for the downlink measurement the MU Attenuation is not used.
That means for downlink measurements the signal generator is connected to measurement point A at the master optical / electrical converter and the analyzer to the measurement point B at the RU.

2.1.5 Downlink System Gain and Output Power

System optimized for BTS power **Z**	MU Attenuation *(manual leveling)*	Maximum rated input power at the MU OTRX **B**	RU Gain **B to A**	Maximum rated output power at RU Antenna port **A**
+33 dBm	**34 dB**	**-1 dBm**	**+32 dB**	**+31.0 dBm** *@ 1 carrier*
System Gain Z to B	**-2 dB**			
+43 dBm	**44 dB**	**-1 dBm**	**+32 dB**	**+31.0 dBm** *@ 1 carrier*
System Gain Z to B	**-12 dB**			

table 2.1.5-#1 Equipment under test (E.U.T.) Description Downlink System Gain and Output Power

3 Test site (Andrew Buchdorf)

3.1 Test environment

All tests were performed under the following environmental conditions:

Condition	Minimum value	Maximum value
Barometric pressure	86 kPa	106 kPa
Temperature	15°C	30°C
Relative Humidity	20 %	75 %
Power supply range	±5% of rated voltages

CIU = Calibrate in use

3.3 Input and output losses

All recorded power levels should be referenced to the input and output connectors of the repeater, unless explicitly stated otherwise.
The test equipment used in this test has to be calibrated, so that the functionality is also checked.
All cables, attenuators, splitter, isolator, circulator and combiner etc. must be measured before testing and used for compensation during testing.

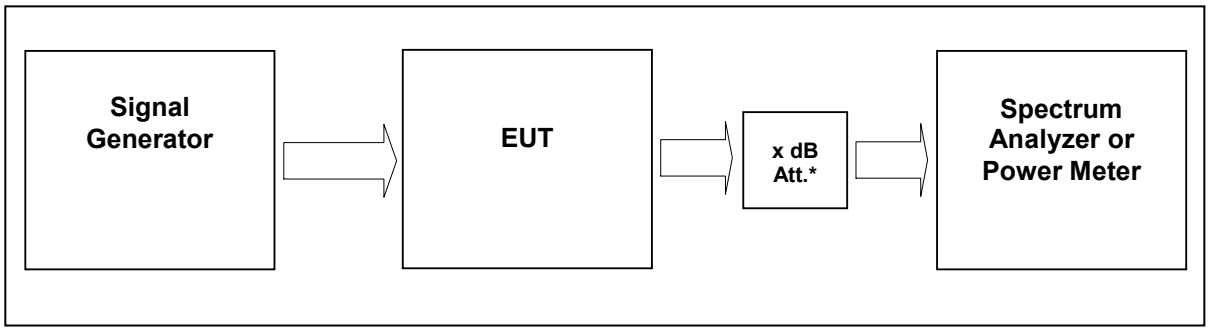
3.4 Measurement uncertainty

The extended measurement uncertainty corresponds to the measurement results from the standard measurement uncertainty multiplied by the coverage factor k=2. The true value is located in the corresponding interval with a probability of 95 %.

4 Test site (Bureau Veritas Consumer Products Services)

FCC Test site: **96997**
IC OATS: **IC3475A-1**
See relevant dates under section 10 of this test report.

5 RF Power Out: §90.635, §2.1046



External Attenuator x dB = 20 dB

Figure 5-#1 Test setup: RF Power Out: §90.635, §2.1046

Measurement uncertainty	± 0,38 dB
Test equipment used	9054, 9233, 7444; 7306; 7144; 7454; 7453; 7341; 7449; 7368

5.1 Limit

Minimum standard:

§90.541 Transmitting power limits.
The transmitting power of base, mobile, portable and control stations operating in the 769-775 MHz and 799-805 MHz frequency bands must not exceed the maximum limits in this section, and must also comply with any applicable effective radiated power limits in §90.545.
(a) The transmitting power of base transmitters must not exceed the limits given in paragraphs (a), (b) and (c) of §90.635.

§ 90.635 Limitations on power and antenna height.
(a) The effective radiated power and antenna height for base stations may not exceed 1 kilowatt (30 dBw) and 304 m. (1,000 ft.) above average terrain (AAT), respectively, or the equivalent thereof as determined from the Table. These are maximum values, and applicants will be required to justify power levels and antenna heights requested.

5.2 Test method

§ 2.1046 Measurements required: RF power output.

(a) For transmitters other than single sideband, independent sideband and controlled carrier radiotelephone, power output shall be measured at the RF output terminals when the transmitter is adjusted in accordance with the tune-up procedure to give the values of current and voltage on the circuit circuit elements specified in § 2.1033(c)(8). The electrical characteristics of the radio frequency load attached to the output terminals when this test is made shall be stated.

(c) For measurements conducted pursuant to paragraphs (a) and (b) of this section, all calculations and methods used by the applicant for determining carrier power or peak envelope power, as appropriate, on the basis of measured power in the radio frequency load attached to the transmitter output terminals shall be shown. Under the test conditions specified, no components of the emission spectrum shall exceed the limits specified in the applicable rule parts as necessary for meeting occupied bandwidth or emission limitations

5.3 Test Results

Detector RMS.

Test signal Analog:
FM signal with 3.0 kHz deviation and 2.5 kHz rate and sine waveform.

Test signal APCO Phase1 C4FM:
Modulation 4FSK, with 1.8 kHz deviation and 4.8 ksym/s symbol rate

Test signal APCO Phase2 H-DQPSK:
Modulation pi/4-DQPSK, 6 ksym/s symbol rate

According to ANSI C63.4 section 13.1 Table 5 for operating frequencies more then 10MHz: The test shall be performed at Bottom, Middle and Top frequencies.

5.3.1 Downlink

Modulation	Measured at		RBW VBW Span	RF Power [dBm]	RF Power [W]	Plot -
Analog	Middle	772 MHz	100kHz 300kHz 1,5MHz	31.0	1.26	5.3.1.1 #1
APCO Phase1 C4FM	Middle	772 MHz	100kHz 300kHz 1,5MHz	31.0	1.26	5.3.1.2 #1
APCO Phase2 H-DQPSK	Middle	772 MHz	100kHz 300kHz 1,5MHz	31.0	1.26	5.3.1.3 #1
Maximum output power = 31.0 dBm = 1.26 W						
Limit Maximum output power = 60 dBm = 1000 W (erp)						

Table 5.3.1-#1 RF Power Out: §90.635, §2.1046 Test Results Downlink

The max RF Power out is 31 dBm, so the maximum antenna gain (x) can be calculated as follow:

Limit = 1000W (erp) = **60 dBm** Info: 1000W (erp) = 1640W (eirp)

60 dBm **>** 31 dBm + x ------> x = 60 dBm – 31 dBm = 29 dBd

x dBi = 29 dBd + 2.15 = 31.15 dBi

=> The antenna that will use for the complete system have to have a gain lower than 31.15 dBi, relative to a dipol.

Modulation	Pin / dBm (Ref. point A)
Analog	-2.0
APCO Phase1 C4FM	-2.8
APCO Phase2 H-DQPSK	-2.1

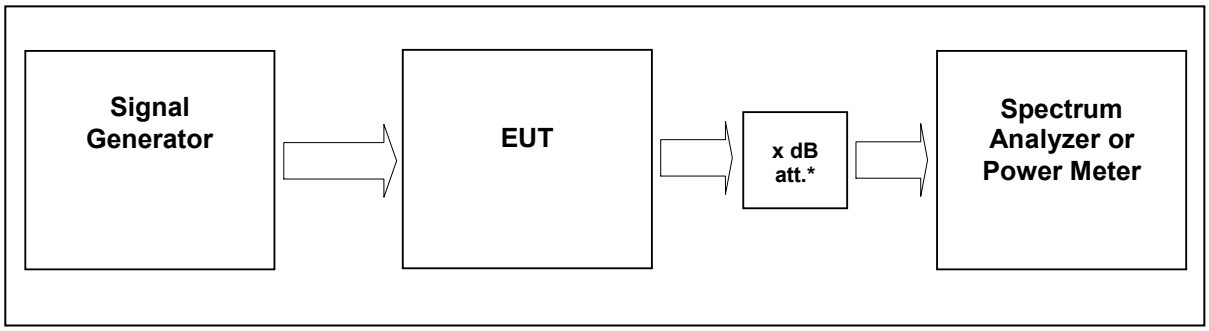
5.4 Summary test result

Test result	complies, according the plots above
Tested by:	M. Leinfelder
Date:	18.02.2014

6 Occupied Bandwidth: §2.1049



External Attenuator x dB = 20 dB

Figure 6-#1 Test setup: Occupied Bandwidth: §2.1049

Measurement uncertainty	± 0,38 dB
Test equipment used	9054, 9052, 7366, 7367, 7299, 7280, 7363

6.1 Limit

The spectral shape of the output should look similar to input for all modulations.

6.2 Test method

Para. No.2.1049
The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured under the following conditions as applicable:

6.3 Test results

7.1 Limit

§ 90.543 Emission limitations.
Transmitters designed to operate in 769–775 MHz and 799–805 MHz frequency bands must meet the emission limitations in paragraphs (a) through (d) of this section. Transmitters operating in 763–768 MHz and 793–798 MHz bands must meet the emission limitations in(e) of this section.
Limit -13dBm

7.2 Test method

7.2.1 FCC CFR47

Para. No 2.1051 Measurements required: Spurious emissions at antenna terminals.
The radio frequency voltage or powers generated within the equipment and appearing on a spurious frequency shall be checked at the equipment output terminals when properly loaded with a suitable artificial antenna. Curves or equivalent data shall show the magnitude of each harmonic and other spurious emission that can be detected when the equipment is operated under the conditions specified in § 2.1049 as appropriate. The magnitude of spurious emissions which are attenuated more than 20 dB below the permissible value need not be specified.

Test set-up:

Test location: SAC
Both, the Fully Anechoic Chamber (FAC) and the Semi Anechoic Chamber (SAC) fulfil the requirements of ANSI C63.4 and CISPR 16-1-4 with regards to NSA and SVSWR.
Test Voltage: 115V / 60 Hz
Type of EUT: Wall mounted

Measurement uncertainty:

Measurement uncertainty expanded (95% or K=2)	± 4,7 dB for ANSI C63.4 measurement ± 0,5 dB for TIA-603 measurement

10.1 Method of Measurement

Measurement procedure. **TIA-603-C**

The antenna substitution method is used to determine the equivalent radiated power at spurious frequencies. The spurious emissions are measured at a distance of 3 meters. The EUT is then replaced with a reference substitution antenna with a known gain referenced to a dipole. This antenna is fed with a signal at the spurious frequency. The level of the signal is adjusted to repeat the previously measured level. The resulting eirp is the signal level fed to the reference antenna corrected for gain referenced to an isotropic dipole (see Figure 7.2).

From KDB (AMPLIFIER, BOOSTER, AND REPEATER REMINDER SHEET):
Radiated spurs (enclosure) – Use of CW signal (low, mid. and high freq.) is acceptable rather than all modulations.

The maximum RFI field strength was determined during the measurement by rotating the turntable (±180 degrees) and varying the height of the receive antenna (h = 1 ... 4 m) as like defined in ANSI C63.4. A measurement receiver has been used with a RBW 120 kHz up to 1 GHz and 1 MHz above 1 GHz. Steps with during pre measurement was half the RBW.

Both, the Fully Anechoic Chamber (FAC) and the Semi Anechoic Chamber (SAC) fulfil the requirements of ANSI C63.4 and CISPR 16-1-4 with regards to NSA and SVSWR.

10.2 Limit

§ 90.543 Emission limitations.
Transmitters designed to operate in 769–775 MHz and 799–805 MHz frequency bands must meet the emission limitations in paragraphs (a) through (d) of this section. Transmitters operating in 763–768 MHz and 793–798 MHz bands must meet the emission limitations in(e) of this section.
Limit -13dBm

10.3 Climatic values in the lab

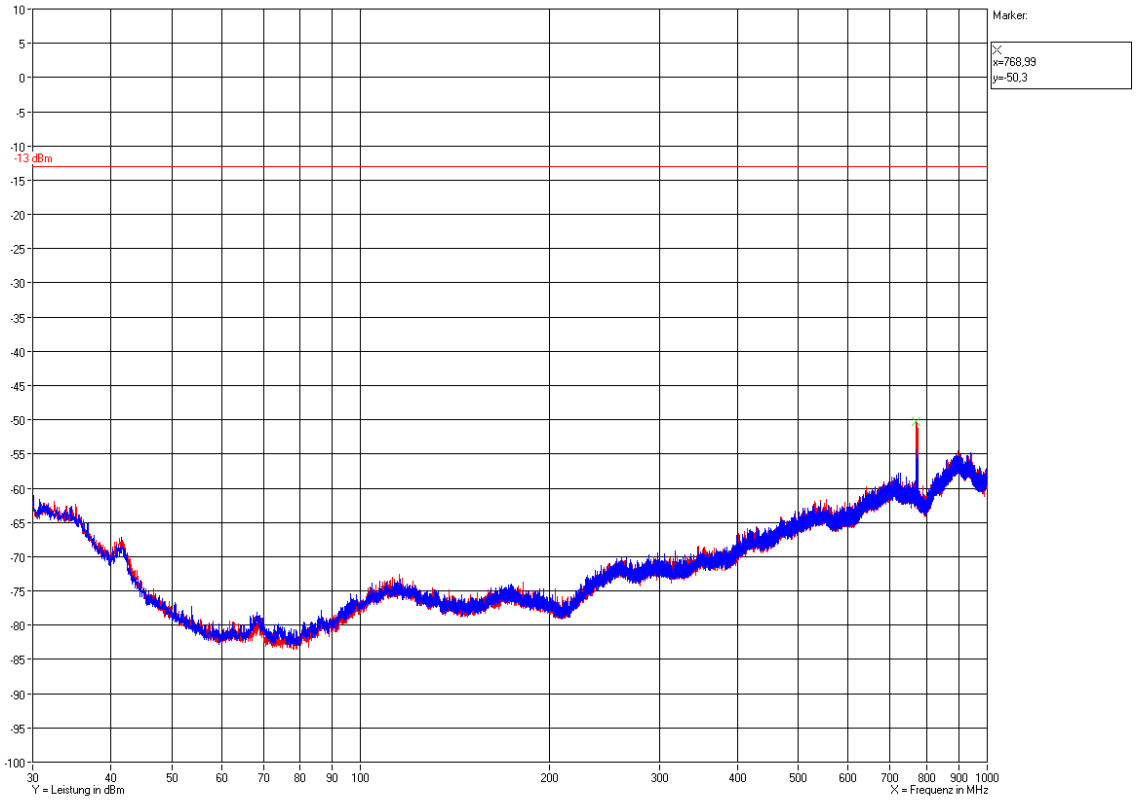
Temperature:	19,5°
Relative Humidity:	43%
Air-pressure:	998 hPa

10.4 Test results

10.4.1 30 MHz to 1 GHz Downlink (Bottom – Middle – Top) Subpart H

Bottom: 769 MHz; Middle: 772 MHz; Top: 775 MHz

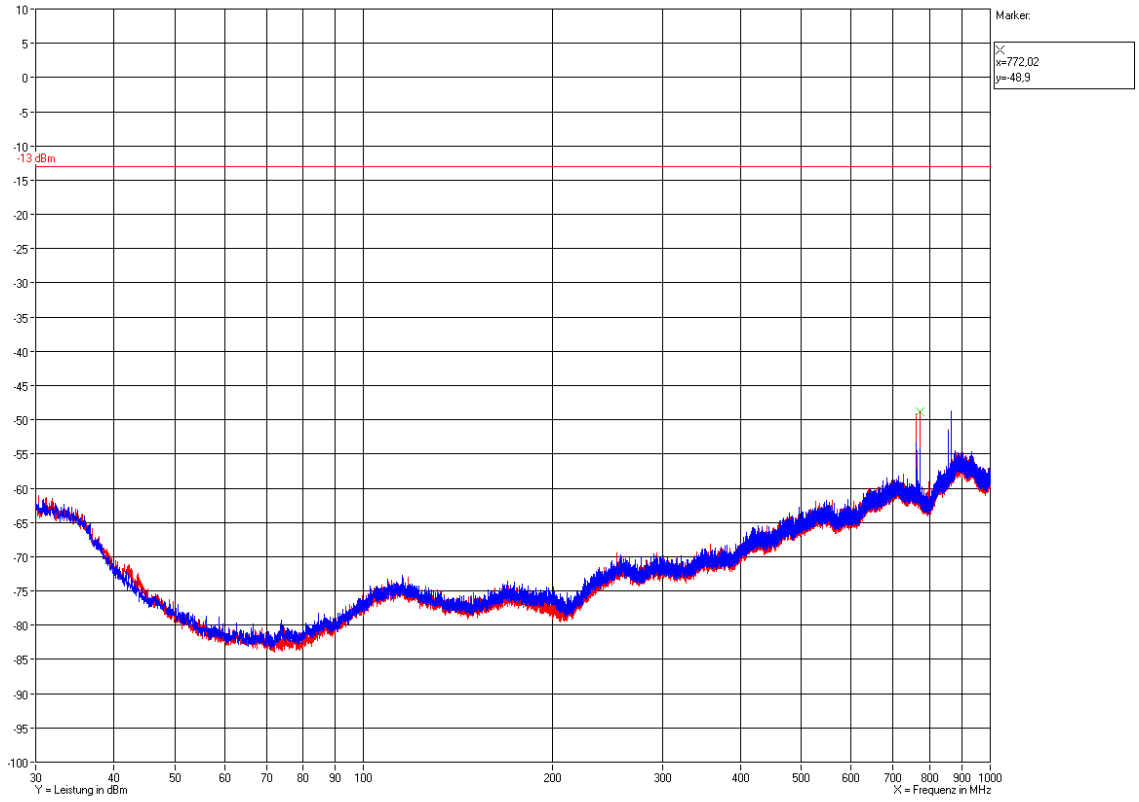
Vertikal / Horizontal



10.4.3 30 MHz to 1 GHz Downlink (Middle of all paths)

F1: 763 MHz; F2: 772 MHz; F3: 856.5 MHz; F4: 865.5 MHz

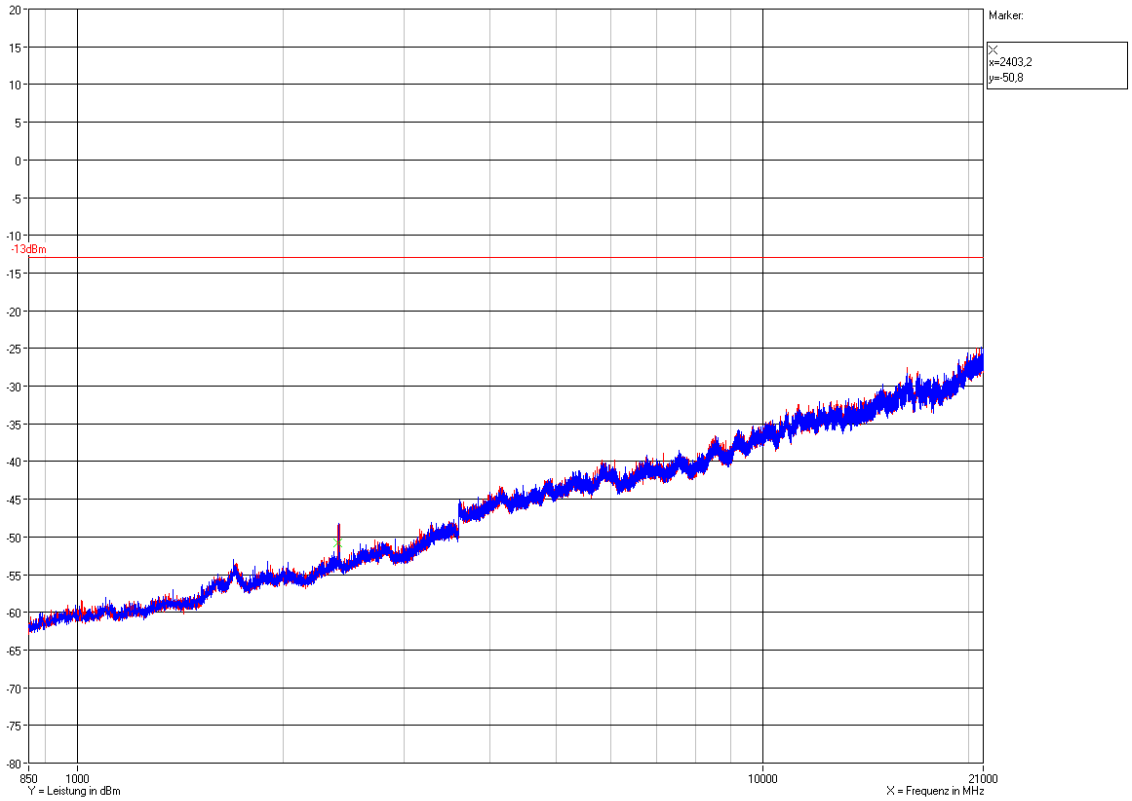
Vertikal / Horizontal



10.4.4 1 GHz to 21 GHz Downlink (Bottom – Middle – Top) Subpart H

Bottom: 769 MHz; Middle: 772 MHz; Top: 775 MHz

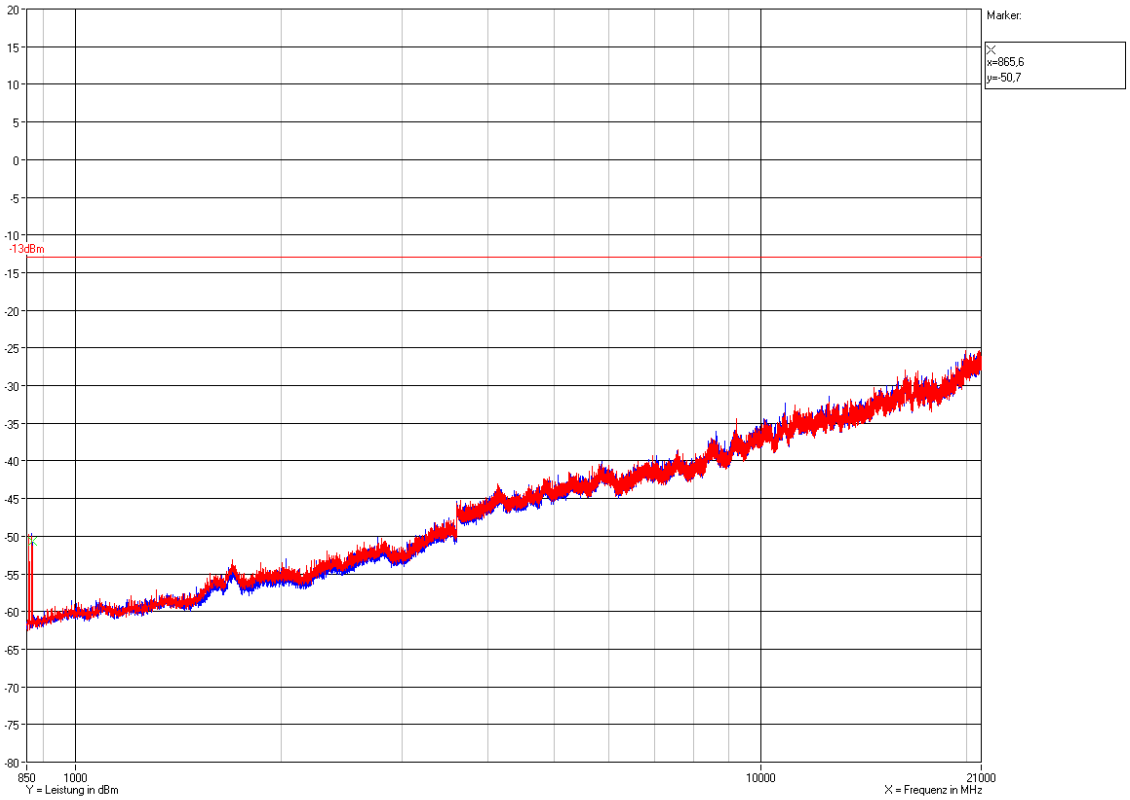
Vertikal / Horizontal



10.4.6 1 GHz to 22 GHz Downlink (Middle of all paths)

F1: 763 MHz; F2: 772 MHz; F3: 856.5 MHz; F4: 865.5 MHz

Vertikal / Horizontal



FEK / 12.08.2014

The radiated spurious emission measurements have been passed!
