Based on report template:
v090319

Equipment Under Test (EUT):	SRG3900XN
Test Commissioned by:	Sepura PLC Radio House St Andrews Road Cambridge Cambridgeshire CB4 1GR
Representative:	Steve Wood
Test Started:	27th August 2014
Test Completed:	16th November 2014
Test Engineer:	Dave Smith
Date of Report:	30th October 2014

Written by:	Dave Smith	Checked by:	Derek Barlow
Signature:		Signature:	Date:	30th October 2014	Date:	4th November 2014

dB Technology can only report on the specific unit(s) tested at its site. The responsibility for extrapolating this data to a product line lies solely with the manufacturer.

Test Standards Applied

Part 90 of CFR47	*Private Land Mobile Radio Services*

CFR 47 Class B	*Code of Federal Regulations: Pt 15 Subpart B- Radio Frequency Devices - Unintentional Radiators*

Emissions Test Results Summary

Part 90 **PASS**

Test	Port	Method	Limit	PASS/FAIL	*Notes*
Output Power Radiated		90.205	90.205(h)	No Limit	#1
Output Power Conducted	antenna	90.205 2.1046	90.205(h)	No Limit	#1
Types of Emissions	antenna	90.207 2.1047	Specified by manufacturer		
Bandwidth	antenna	90.209 2.1049	90.209(b)(5)	PASS	#2
Emissions Masks Radiated		90.210 2.1051	90.221(d)	PASS	#3
Emissions Masks Conducted	antenna	90.210 2.1051	90.221(d)	PASS	#3
Frequency Stability	antenna	90.213 2.1055	90.213	PASS	
Frequency Transient Behaviour	antenna	90.214	90.214	N/A	#4
Adjacent Channel Power		90.221	90.221(b)	PASS	

specs_canadav111211

CFR 47 **PASS**

Test	Port	Method	Limit	PASS/FAIL	*Notes*
Conducted Emissions	ac power	ANSI C63.4:2003	FCC(B)	N/A	#5
Radiated Emissions		ANSI C63.4:2003	FCC(B)	PASS	

specs_fccv100412

#1 There is no specific limit on output power.
#2 The additional note 6 was applied which allows a bandwidth of up to 22kHz providing the additional Adjacent Channel Power requirements are met.
#3 The additional note 5 was applied which only stipulates limits 75kHz from the carrier providing the additional Adjacent Channel Power requirements are met.
#4 Not applicable for devices operating in the 809MHz to 824MHz and 854MHz to 869MHz bands.

This Report shows that the EUT met all of the requirements for the tests performed - as shown above.

1 EUT Details

1.1 General

The EUT was a TETRA Voice + Data Mobile Station. The transmitter can operate over the following frequency bands:

809MHz to 824MHz - in Trunked-Mode Operation (TMO)
854MHz to 869MHz - in Direct-Mode Operation (DMO)

The receiver can operate over the following frequency bands:

854MHz to 869MHz

Measurements were made at the top, near middle and bottom of the appropriate frequency ranges:

Bottom: 809 MHz
Middle: 816.5 MHz
Top: 824 MHz

and

Bottom: 854 MHz
Middle: 861.5 MHz
Top: 869 MHz

The nominal output power is 40dBm (10W).

Unless otherwise stated, tests were performed with nominal power supply voltage.

The device can be used with a variety of peripherals and therefore radiated tests were performed in two separate configurations. Details of the configurations are given in the tables below.

	Description	P/N	Gain
Configuration 1	Tetra		
Configuration 2/DMU	Tetra for DMU		

The product is intended to comply with the FCC part 90 requirements - specifically the sections applicable to Tetra devices.

Radiated field strength tests were performed at the dB Technology Test Site Registered with the FCC: Registration number: 90528.

Output Stage Settings:

With reference to the requirements of **2.1046(a)** and **2.1033(c)(8),** the DC voltages and currents in the elements of the final radio are regulated within the product and not user variable.

Modulation Characteristics:

With reference to the requirements of **2.1047,** the device uses digital modulation which is not proportional in any way to the level or frequency of the audio signal. We consider that compliance with the relevant Mask of Part 90 using pseudo random digital data is sufficient to adequately demonstrate the Modulation Characteristics as per Section 2.1047.

1.2 Modifications to EUT and Peripherals

Details of any modifications that were required to achieve compliance are listed below. The modification numbers are referred to in the results sections as appropriate.

Mod No:	Details	Implemented for
0	Original sample as supplied.	

1.3 EUT Operating Modes

The EUT was tested in the following operating mode or modes. Generally, operating modes are chosen that will exercise the functions of the EUT as fully as possible and in a manner likely to produce maximum emission levels or susceptibility. Individual test result sheets reference the operating mode of the EUT.

Operating Mode	Details
1	Transmitting on selected channel.
2	Receiving on selected channel.

The Tetra Test Set is owned by Sepura.

3 Test Methods

3.1 Antenna Conducted Carrier Power

The antenna output is connected to a spectrum analyser via a suitable PAD. The bandwidth on the spectrum analyser is set to greater than the EUT occupied bandwidth. A peak measurement is recorded. Additional measurements are made with antenna output connected to a power meter providing average measurements.

3.2 Antenna Conducted Transmitter Unwanted Emissions

Measurements are made with the antenna output connected to a spectrum analyser via a suitable PAD. Sweeps are made over the specified frequency ranges . The limit is set relative to the measured carrier power. A peak detector is used.

3.3 Antenna Conducted Occupied Bandwidth

Measurements are made with the antenna output connected to a spectrum analyser via a suitable PAD. Sweeps are made with a 300Hz Resolution Bandwidth and a 1kHz Video Bandwidth. A peak detector is used. Markers are used to determine the 99% power bandwidth.

3.4 Frequency Stability

The EUT is placed in an environmental chamber. The temperature inside the chamber is set to the required level and allowed to stabilise.

For DMO mode the antenna output is connected to a spectrum analyser via a suitable PAD. The EUT is set to transmit with constant carrier (at a frequency 2.25kHz above channel centre frequency). The frequency is measured using the frequency counter function of the spectrum analyser.

For TMO mode the antenna output is connected to a Tetra Test Set. The EUT is set to transmit using normal burst operation. the frequency error, as indicated by the Tetra Test Set, is recorded.

Measurements are made at the specified temperature and over the required voltage supply range of the EUT.

3.5 Radiated Transmitter Emissions (Substitution Method)

Initial scans are performed in a semi-anechoic screened room at a distance of 3m. Scans are performed over the frequency range specified in the test standard with the antenna both horizontally and vertically polarised. During these scans the EUT and peripherals are rotated through 360°. Bench top EUTs are placed on a non-conducting bench at a height of 0.8m above the ground plane. Floor standing EUTs are placed 0.1m above the ground plane. The EUT cables were manipulated in an attempt to produce maximum emissions. The results of the scans are shown in the plots included at the end of the report.

Significant emissions identified by the scans are measured using a substitution method. Maximised emission readings are obtained by rotating the EUT through 360° and adjusting the height of the antenna from 1m to 4m. Measurements are made with the antenna both horizontally and vertically polarised and the results tabulated.

The EUT is then replaced with a calibrated reference antenna fed from a signal generator. The level fed into the reference antenna is measured with a power meter. Measurements are made to determine the power output of the signal generator required to give the same emission levels as were observed from the EUT.

The radiated power from the EUT is calculated as:

Signal Level fed into Reference Antenna	+ Gain of Reference Antenna	+ Radiated Level From EUT	- Radiated Level From Reference Antenna

For example, assuming following measurements:

Signal Level fed into Reference Antenna	=	-14.3dBm
Gain of Reference Antenna	=	7.1 dBi
Radiated Level from EUT (i.e. Level at Measuring Receiver)	=	37 dBuV
Radiated Level from Reference Antenna (i.e. Level at Measuring Receiver)	=	61.5 dBuV

Then the Radiated Power from the EUT = -14.3 + 7.1 +37 - 61.5 dBm (isotropic)
= - 31.7 dBm (isotropic)

3.6 Receiver Radiated Emissions

Initial scans are performed in a semi-anechoic screened room at a distance of 3m. Scans are performed over the frequency range specified in the test standard with the antenna both horizontally and vertically polarised. During these scans the EUT and peripherals are rotated through 360°. Bench top EUTs are placed on a non-conducting bench at a height of 0.8m above the ground plane. Floor standing EUTs are placed 0.1m above the ground plane. The EUT cables were manipulated in an attempt to produce maximum emissions. The results of the scans are shown in the plots included at the end of the report.

Significant emissions identified by the scans are measured on an open area test site at the appropriate test distance using a CISPR16 quasi-peak receiver. Maximised readings are obtained by rotating the EUT through 360° and adjusting the height of the antenna from 1m to 4m. Measurements are made with the antenna both horizontally and vertically polarised and the results tabulated.

Tabulated results show levels based on the following calculation:

Field Strength (dBuV) = receiver reading (dBuV) + CF (dB/m)

CF is the correction factor for the antenna and cable.

For example:

at 114MHz receiver reading was 17.9 dBuV, combined correction factor = 13.1 (dB/m).

Total field strength = 17.9 + 13.1 = 31.0 dBuV/m.

3.7 Conducted Emissions - ac power

This section describes the general method of performing this test. The specific method used and any deviations from this general method are listed in the appropriate results section.

Bench top EUTs and peripheral equipment are normally placed on a 0.8m high non-conducting bench, positioned 0.4m from one of the metallic walls of a screened room. Floor standing EUTs are normally placed 0.1m above the metallic floor of the screened room. Mains leads are bundled so as not to exceed 1m.

The EUT is powered using a 50ohm/50uH Line Impedance Stabilisation Network (LISN). Peripherals are powered using a second a 50ohm/50uH LISN. These LISNs are bonded to the screened room floor.

With the correct supply voltage applied to the EUT scans are performed on both the live and neutral line outputs of the LISN using quasi-peak detection over the specified frequency range. The results of these scans are shown in the plots section at the end of the report.

Significant emissions identified by the scans are measured and the results tabulated. The table of results is shown in the conducted emissions results section.

Final Level (dBuV)	=	Receiver Reading (dBuV)	+	Combined Cable & Attenuator Correction Factor (dB)

Example:

@ 191kHz Final Level = 45.8 + 10.0 = 55.8 dBuV

4 Test Results

The following sections contain tabulated test results. Plots of various scans are included at the back of this section.

4.1 Conducted Antenna Output Power

Ports:			
Test:		using limits of	

Notes	Comments and Observations

Spectrum anlayser results using a peak detector are shown in plots 1 to 6.

Measurements were also made using a power meter with an average detector.

Measurements were made with continuous modulation.

Taking into account the loss of the cable and attenuators the following measurements were made:

Channel	Peak dBm	Average dBm
809 MHz	43.3	40.3
816.5 MHz	43.3	40.3
824 MHz	43.3	40.3
854 MHz	43.2	40.3
861.5 MHz	43.1	40.2
869 MHz	43.1	40.2

Ports:			
Test:		using limits of	

Notes	Comments and Observations

Measurements were made with continuous modulation applied.
Spectrum analyser results are shown in plots 7 to 12.

Using the 99% Bandpower function of the spectrum analyser, the following measurements were recorded:

809 MHz 20.96 kHz

816.5 MHz 20.96 kHz

824 MHz 20.96 kHz

854 MHz 21.00 kHz

861.5 MHz 21.00 kHz

869 MHz 20.96 kHz

Limit:

Using note 6 of Part 90.209, the limit is 22kHz
(providing Adjacent Channel Power requirements are met).

Ports:			
Test: 90.221	using limits of	90.221(b)	
Ports:			
Test:	using limits of		

Notes	Comments and Observations

Using a spectrum analyser with the appropriate Tetra adjacent channel power settings. Captured results are shown in plots 13 to 18.

Readings in dBc

Channel

	-75kHz	-50kHz	-25kHz	+25kHz	+50kHz	+75kHz
809MHz	-80.82	-77.17	-64.64	-62.16	-76.84	-80.71
816.5MHz	-80.47	-77.05	-63.06	-61.62	-76.88	-80.79
824MHz	-80.06	-76.15	-62.73	-61.39	-76.06	-79.58
854MHz	-79.85	-76.640	-62.84	-61.33	-76.63	-80.01
861.5MHz	-79.72	-75.990	-62.57	-61.2	-76	-79.35
869MHz	-79.68	-75.730	-62.14	-61.16	-75.86	-79.32
Limit (dBc)	-65	-65	-55	-55	-65	-65
	PASS	PASS	PASS	PASS	PASS	PASS

Limit shown is the maximum allowed level (dBc) for a product with output power less than 15 W and operating in the 809MHz to 869MHz bands (Part 90.221(c)

PASS

4.8 Conducted Emission Antenna Spurious Emissions

Factor Set 1:
Factor Set 2: - - - -
Factor Set 3: - - - -
Test Equipment: R13 RFF17 RFF15 RFF22

Conducted Emissions (Signal)

Company:	Sepura PLC	*Product:*	SRG3900XN
Date:	24/09/2014	*Test Eng:*	Dave Smith
Ports:	antenna		
Test:	90.210	using limits of	90.221(d)
Ports:			
Test:		using limits of	

Notes	Comments and Observations

Results of scans shown in plots 19 to 26.

The limit line shown on the plots is at -13dBm.

All spurious emissions were below this limit.

The limit of -13dBm was derived as follows:

The applicable Mask is taken from part 90.221(d) which specifies an attenuation of:

43 + 10 log (P)

If the output is P Watts, the absolute limit is given by:

10 log (P) - (43 + 10 log (P)) = -43dBW

converting to dBm:

-43dBW = -13 dBm

This absolute limit is therefore the same (-13dBm) regardless of the actual measured output power P.

PASS

Results	**Minimum Margin**	**3.5 dB**	
	PASS/FAIL	**PASS**	

Notes	Comments and Observations
#1	Results of scans shown in plots 43 and 47. During prescans in screened room these emissions were identified as narrow band. Measurements with a 30Hz RBW/30Hz VBW peak detector were no more than 1 dB lower than a measurement with a 120kH QP detector. Because of ambients/noise floor, a 30Hz RBW/30Hz VBW peak detector was used on the open area test site and an additional 1dB added to the correction factor.
