* EUT serial number TA000015 was used for testing both the EPIRB3 Pro and EPIRB3 models: the same PCB and lower part of the housing was the same for both models. A change in the clear plastic and antenna section of the EPIRB differentiates between the two models, with the EPIRB3 Pro utilising a fixed antenna and the EPIRB3 utilising a ‘wind up’ antenna.

1.3 Brief Summary of Results

1.5 Product Information

1.5.1 Technical Description

The Equipment under test (EUT) was an Ocean Signal Limited EPIRB3 Pro and EPIRB3.

The EPIRB3 Pro and EPIRB3 are 406 MHz Emergency Position Indication Radio Beacons with a 121.5 MHz homing transmitter and AIS signal locating function.

The EUTs are designed to be used to alert emergency services to aide rescue in grave and imminent danger. The devices also contain an RFiD transmitter which can be used when the beacons are not active.

1.5.2 Test Configuration

Configuration	Description
EPIRB3 (windup antenna) in manual housing	The EUT was installed into the manual housing
EPIRB3 (windup antenna) standalone	The EUT was tested in isolation
EPIRB3Pro (fixed antenna) in float free housing	The EUT was installed into the float free housing

1.5.4 Monitoring of Performance

Mode	Description
EPIRB idle, RFiD active	A spectrum analyser was connected to an antenna inside the chamber to monitor for unintentional transmissions from the EUT.
EPIRB active, RFiD idle	A GPS simulator used to transmit a fixed position to the EUT. A beacon tester was used to monitor the EUT's 406 MHz transmissions including a check of GPS position. A spectrum analyser was connected to an antenna inside the chamber to confirm presence of the 121 MHz homing transmitter and AIS locating signal from the EUT.

Table 5

1.5.5 Performance Criteria

Performance Criteria A

The apparatus shall continue to operate as intended during and after the test. No degradation of performance or loss of function is allowed below a performance level specified by the manufacturer when the apparatus is used as intended. The performance level may be replaced by a permissible loss of performance. If the minimum performance level or the permissible performance loss is not specified by the manufacturer, either of these may be derived from the product description and documentation and what the user may reasonably expect from the apparatus if used as intended.

The manufacturers specified performance level is detailed as:

No loss of EUT function or degradation of performance during and after the test is applied.

Performance Criteria B

The apparatus shall continue to operate as intended after the test. No degradation of performance or loss of function is allowed below a performance level specified by the manufacturer when the apparatus is used as intended. The performance level may be replaced by a permissible loss of performance. During the test, degradation of performance is however allowed. No change of actual operating state or stored data is allowed. If the minimum performance level or the permissible performance loss is not specified by the manufacturer, either of these may be derived from the product description and documentation and what the user may reasonably expect from the apparatus if used as intended.

The manufacturers specified performance level is detailed as:

No loss of EUT function or degradation of performance after the test is applied.

1.6 Deviations from the Standard

No deviations from the applicable test standard were made during testing.

1.7 EUT Modification Record

The table below details modifications made to the EUT during the test programme.

The modifications incorporated during each test are recorded on the appropriate test pages.

2.1.3 Date of Test

11-May-2022

2.1.4 Test Method

The equipment under test including associated cabling was configured on a 0.8 m non-conductive table for table-top equipment and on a 0.1 m insulated support for floor standing equipment; with a pre-calibrated semi anechoic chamber.

Three axes of the equipment under test were subjected to the required RF field strength, modulated as described, swept over the frequency range of test with the antenna positioned in both horizontal and vertical polarisations.

During this test, any anomalies in the equipment under tests' performance were recorded.

2.1.5 Environmental Conditions

Ambient Temperature	25.5 °C
Relative Humidity	41.9 %

2.1.6 Specification Limits

Required Test Levels					Performance Criteria

1000 to 2000	10[2]	AM (80 %,400 Hz, sine wave)	1	9[1]	A
Supplementary information: Note 1. Dwell times <1GHz can be reduced to 2 s and >1GHz to 5 s for samples with fast cycle times. Note 2. As detailed in specification clause 5.3 Test results, the EUT shall pass the test only if the measured performance margin is favourable and greater than the test measurement uncertainty.

2.2.4 Test Method

The equipment under test including associated cabling was configured on a horizontal coupling plane fitted with a 0.5mm insulated surface attached to the top of a 0.8m non-conductive table for table-top equipment or on a 0.1m insulated support for floor standing equipment, above a ground reference plane within a test laboratory.

Using the air discharge method for non-metallic parts, the contact discharge method for metallic parts and with both vertical and horizontal couple plane discharge methods for the sides of the equipment under test, the required electrostatic discharge voltage levels in both voltage polarities were applied at the detailed pulse repetition rate.

During this test, any anomalies in the equipment under tests' performance were recorded.

2.3.3 Date of Test

07-June-2022 and 10-June-2022

2.3.4 Test Method

The EUT was setup on an East to West oriented level non-magnetic surface.

A magnetometer was used to take a horizontal magnetic flux density measurement and from this measurement a standard and an emergency compass deflection was calculated.

A ships magnetic compass was located at the west end of the non-magnetic surface.

The compass was zeroed and the EUT was gradually moved from the east to the west end of the non-magnetic surface towards the compass centre in all 6 of its orthogonal planes and in 3 different states until the calculated compass deflection was achieved, or the EUT had reached the boundary of the ships magnetic compass.

Once all raw readings had been obtained, the worst case reading for each state was rounded up to the nearest 50 mm or 100 mm.

2.3.5 Environmental Conditions

Ambient Temperature	20.2 - 21.2 °C
Relative Humidity	46.5 - 46.6 %

2.3.6 Specification Limits

For the steering compass, the standby steering compass and the emergency compass, the permitted deviation is 18°/H, H being defined as the horizontal component of the magnetic flux density in μT's (micro-tesla's) at the location that testing takes place.

4 Incident Reports

No incident reports were raised.

5 Measurement Uncertainty

For a 95% confidence level, the measurement uncertainties for defined systems are:

Test Name	Measurement Uncertainty
Immunity to Radiated Radio Frequencies	80 MHz to 2 GHz Test Amplitude ±2.0 dB
Immunity To Electrostatic Discharge	The test was applied using proprietary equipment that meets the requirements of EN 61000-4-2
Compass Safe Distance	± 0.1 °

Table 30

Worst case error for both Time and Frequency measurement 12 parts in 10^6.

Measurement Uncertainty Decision Rule

Determination of conformity with the specification limits is based on the decision rule according to IEC Guide 115:2007, Clause 4.4.3 and 4.5.1. (Procedure 2). The measurement results are directly compared with the test limit to determine conformance with the requirements of the standard.

Risk: The uncertainty of measurement about the measured result is negligible with regard to the final pass/fail decision. The measurement result can be directly compared with the test limit to determine conformance with the requirement (compare IEC Guide 115). The level of risk to falsely accept and falsely reject items is further described in ILAC-G8.
