DECLARATION

TGRF-3XXX-C Wireless Data Logger family

This product family is designed to provide monitoring of temperature, humidity, sensor voltages, currents or signals from various locations & relay the data back to a computer for analysis & logging.

Any installation must comprise a minimum of 1 logger & 1 receiver, but typically would incorporate a large number of loggers, spread out over an area of 10s of thousands of square yards, each having up to 4 probes or signal inputs connected.

The loggers automatically establish a wireless network between themselves, & learn their position & responsibilities within the network.

The loggers only work with probes or input cables supplied by Gemini.

The system is configured & controlled by custom software written by Gemini & supplied with the loggers. Without this software the system is inoperable.

As with all the products produced by Gemini, it is intended for use by the industrial, commercial & scientific user only, & is marketed accordingly.

We sell our products worldwide, through authorised distributors, & also direct to end-users.

Our Terms & Conditions are published for distributors & end-users, printed on the back of all quotations, order acknowledgements and invoices, & include the clause:

"The Gemini products mentioned in this document are for sale to & use by commercial, industrial or scientific users only."
