The difference as compared to the tested type is (according to the manufacturer):

AH30 uses the same type of PCB and radio but have less assembled components, one connector and four relays.

The difference is considered not to imply different Radio-characteristics when compared to the tested type. Therefore, this type is not tested, but considered to have the same Radio-characteristics as the tested type.

**5.1 Test set-up and test procedure.**

The test method is in accordance with ANSI C63.10-2013.  
The EUT was set up in order to emit maximum disturbances.

The EUT was placed on an insulating support 0.8 and 1.5 m above the turntable which is part of the reference ground plane.

Overview sweeps were performed with the measurement receiver in max-hold mode and the peak detector activated in the frequency-range 30 – 1000 MHz. Above 1 GHz additionally the average detector was activated.

EUT is intended to be wall mounted and is therefore measured in one orientation.

(i.e. an extrapolation factor of 20 dB/decade according to CFR 47 §15.31(f)(1))

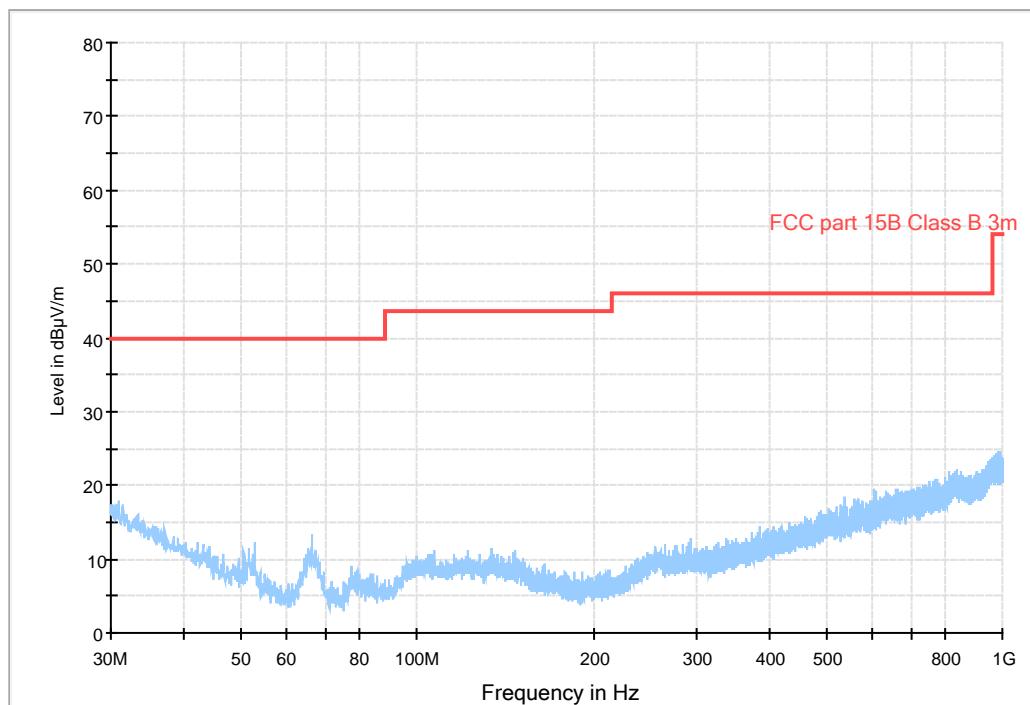

Outside the restricted bands:

Reference: CFR 47 §15.247(d), RSS-247 5.5,

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated device is operating, the RF power that is produced shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided that the transmitter demonstrates compliance with the peak conducted power limits.
