3. Method of measurement

3.1. Applicable Standard

According to FCC Part 1.1307(b)(1), systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy level in excess of the Commission's guidelines.

According to FCC Part 1.1310 and FCC Part 2.1091 RF exposure is calculated.

IEEE Std C95.1: 2005: "IEEE Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz – 300 GHz".

FCC OET Bulletin 65, Edition 97-01: "Evaluating Compliance with FCC Guidelines for Human Exposure to Radiofrequency Electromagnetic Fields".

FCC Supplement C to OET Bulletin 65, Edition 01-01: "Additional Information for Evaluating Compliance of Mobile and Portable Devices with FCC Limits for Human Exposure to Radiofrequency Emission".

IEEE Std C95.3: 2002: "IEEE Recommended Practice for Measurements and Computations of Radio Frequency Electromagnetic Fields with Respect to Human Exposure to Such Fields, 100 kHz – 300 GHz",

3.3. Calculating the Safe Distance

Before starting EME measurements, we calculated the safe distance, R_{safe} using the following formula:

$$Rsafe = \sqrt{\frac{P\max \cdot Gn \cdot \eta}{4\pi \cdot S}}$$

G_n: antenna gain (numeric)(EUT antenna gain=5.5dBi)
P_{max}: maximum power input to the antenna (W)
S: power density limit (W/m^2) respectively
η: duty cycle (decimal number), for these measurements $\eta = 0.5$

The results of R_{safe} calculations:
FCC Part 2.1091:
RF Field Strength Limits for Occupational/Controlled Exposure

TX1				
Test Frequency (MHz)	Max Output Power (W)	Antenna Gain (Numeric)	Power Density (mW/cm^2)	Safe Distance (m)
136.0125	60.00	1.9953	1.0000	0.69
155.0125	60.00	1.9953	1.0000	0.69
173.9875	60.00	1.9953	1.0000	0.69

Note:Max Output Power (W)= Rated Output Power (W)+ 20%*Rated Output Power (W)=50+10=60W

3.4. Antenna Information

Description	Gain	Mount Type	Model
vertically polarized	3.0dBi	Roof	TQC-150CII

3.5. Measurement Procedure

1. Polarization of the EUT's antenna was vertical, which is its polarization in actual use.
2. The EUT at the chosen modulation was set to transmit at the chosen frequency at maximum RF power and at 50% duty cycle (50% duty cycle is simulated either by lowering the radio's power by 3dB or by using a 3 dB pad on the output of the radio). During preliminary measurements, we set the distance between the power density probe and the investigated EUT's antenna equal to the average calculated Rsafe applicable either for controlled or uncontrolled environments.
3. Power density measurements were taken at different heights of the probe from the ground (0.1 to 2 meters) while rotating versus azimuth (from 0° to 360°) the antenna.
4. The azimuth between the probe and the antenna position corresponding to the highest MPE level was chosen as the "worst case" position for the final measurements.
5. For the final measurements, we adjusted the distance between the test probe and the tested antenna to the real safe distance, Rreal, such that the measured highest power density in the "worst case" position was the same or slightly less than the test limit.
6. The measurement results of final measurements conducted at the chosen azimuth and different heights of the probe above the ground.
7. Average values of power density were calculated for the imaginary whole human body (0.1–2.0 m), for the lower part of the body (0.1–0.9 m) and for the upper part of the body (1.0–2.0 m).
