

## RF Exposure evaluation

According to 447498 D01 General RF Exposure Guidance

v05

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances  $\leq 50$  mm are determined by:

$$[ \text{max. power of channel, including tune-up tolerance, mW} / (\text{min. test separation distance, mm}) ] \cdot [ \sqrt{f(\text{GHz})} ] \leq 3.0 \text{ for 1-g SAR and } \leq 7.5 \text{ for 10-g extremity SAR,}$$
 where

- $f(\text{GHz})$  is the RF channel transmit frequency in GHz
- Power and distance are rounded to the nearest mW and mm before calculation
- The result is rounded to one decimal place for comparison

Worse case is as below: [2402MHz 4.15dBm(2.6mW)output power]

$$(2.6\text{mW} / 5 \text{ mm}) \cdot [ \sqrt{2.402} \text{ (GHz)} ] = 0.81 < 3.0 \text{ for 1-g SAR}$$

Then SAR evaluation is not required
