0.1 Technical Report Summary

Type of Authorization
Certification for an Intentional Radiator (Periodic operation in the band above 70 MHz)

Applicable FCC Rules

Edition of FCC Rules: 10-1-09

Prepared in accordance with the requirements of FCC Rules and Regulations as listed in 47 CFR Ch.1 Parts 2 and 15. The following subparts are applicable to the results in this test report.

Part 2, Subpart J - Equipment Authorization Procedures, Certification

Part 15, Subpart C – Intentional Radiators

§ 15.201 Equipment authorization requirement

§ 15.207 Conducted limits

§ 15.209 Radiated emission limits; general requirements

§ 15.231 Periodic operation in the band 40.66-40.70 MHz, above 70 MHz

Note:
none

Summary Test Results:

The EUT complied with all performed tests as listed in chapter 0.2 Measurement Summary.

2.1 General EUT Description

Equipment under Test	Vehicle remote keyless entry transmitter
Type Designation:	PL7 ID device
Kind of Device:	315 MHz transceiver
(optional)	
Voltage Type:	DC / (Lithium battery)
Voltage level:	3.0 V
Repeated Operation:	Manually /
	Periodically according to FCC §15.231(a)
The EUT is part of a security or safety system:	No

General product description:

The EUT is a is a wireless handheld Vehicle remote keyless entry transmitter (transceiver, non-periodic operation in the band above 70 MHz). The operating frequency is 315 MHz.

Specific product description for the EUT:

The EUT is a vehicle remote keyless entry transmitter / transceiver which uses FSK modulation. The transmitter is activated manually by a switch and is deactivated automatically within 5 seconds after release of the switch.

The EUT is tested in two different variants of the housing:
one has a style element in “chrome” and for the other at this place the standard plastic of the housing is used. Please refer to the photos.
Within this report the variants are shortly indicated by “chrome” and “non-chrome”.

The EUT provides the following ports:

Ports
Enclosure

The main components of the EUT are listed and described in Chapter2.2.

2.2 EUT Main components

Type, S/N, Short Descriptions etc. used in this Test Report

Short Description	Equipment under Test	Type Designation	Serial No.	HW Status	SW Status	Date of Receipt
EUT A (Code: UG000a02)	Vehicle remote keyless entry transmitter	PL7 ID device "chrome"	– (none)	02	04.01	2010-07-31
Remark: EUT A is equipped with an integral antenna.						
EUT B (Code: UG010a02)	Vehicle remote keyless entry transmitter	PL7 ID device "non-chrome"	– (none)	02	04.01	2010-07-31
Remark: EUT B is equipped with an integral antenna.						
EUT C (Code: UG010b01)	Vehicle remote keyless entry transmitter	PL7 ID device "non-chrome"	– (none)	02	04.01	2010-07-20
Remark: EUT C is equipped with an integral antenna.						

NOTE: The short description is used to simplify the identification of the EUT in this test report.

2.3 Ancillary Equipment

For the purposes of this test report, ancillary equipment is defined as equipment which is used in conjunction with the EUT to provide operational and control features to the EUT. It is necessary to configure the system in a typical fashion, as a customer would normally use it. But nevertheless Ancillary Equipment can influence the test results.

–	–	–	–	–	–	–

2.4 Auxiliary Equipment

For the purposes of this test report, auxiliary equipment is defined as equipment which is used temporarily to enable operational and control features especially used for the tests of the EUT which is not used during normal operation or equipment that is used during the tests in combination with the EUT but is not subject of this test report. It is necessary to configure the system in a typical fashion, as a customer would normally use it. But nevertheless Auxiliary Equipment can influence the test results.

2.5 EUT Setups

This chapter describes the combination of EUTs and ancillary equipment used for testing.

Setup No.	Combination of EUTs	Description
Setup_01	EUT A	setup for measurements in test mode
Setup_02	EUT B	setup for measurements in test mode
Setup_03	EUT C	setup for measurements in application mode (“dwell time”)

2.6 Operating Modes

This chapter describes the operating modes of the EUTs used for testing.

Op. Mode	Description of Operating Modes	Remarks
op-mode 1	periodic operation	Transmitter is sending a pulsed and modulated signal (as used in the application).
op-mode 2	continuous operation cw	Transmitter is sending a CW signal continuously. Special op mode for test purpose only.
op-mode 3	continuous operation mod.	Transmitter is sending a modulated signal continuously. Special op mode for test purpose only.

2.7 Product labeling

2.7.1 FCC ID label

Please refer to the documentation of the applicant.

2.7.2 Location of the label on the EUT

Please refer to the documentation of the applicant.

3 Test Results

3.1 Duty cycle measurement (based on dwell time measurement)

Standard FCC Part 15, 10-1-09 Edition Subpart C

The test was performed according to: FCC §15.35, §15.231

3.1.1 Test Description

The Equipment Under Test (EUT) was setup in a shielded room to perform the dwell time measurements. For analyzer settings please see measurement plots in annex.

3.1.2 Test Limits

Depending on the function of the EUT different paragraphs of FCC §15.231 apply:

Either
(a)(1): A manually operated transmitter shall employ a switch that will automatically deactivate the transmitter within not more than 5 seconds of being released.

Or
(a)(2) A transmitter activated automatically shall cease transmission within 5 seconds after activation.

And
(a)(3) Periodic transmissions at regular predetermined intervals are not permitted. However, polling or supervision transmissions, including data, to determine system integrity of transmitters used in security or safety applications are allowed if the total duration of transmissions does not exceed more than two seconds per hour for each transmitter. There is no limit on the number of individual transmissions, provided the total transmission time does not exceed two seconds per hour.

Otherwise
(e) Intentional radiators may operate at a periodic rate exceeding that specified in paragraph (a) of this section and may be employed for any type of operation [...].
In addition, [...] the duration of each transmission shall not be greater than one second and the silent period between transmissions shall be at least 30 times the duration of the transmission but in no case less than 10 seconds.

This test is also performed to determine the pulse train of the transmitter and calculate the correction factor for pulse modulated transmitters according to FCC §15.35. This factor is used as a correction factor for the field strength measurements, both for Spurious radiated emissions and Peak power output.

3.1.3 Test Protocol

Temperature: 25 °C
Air Pressure: 1002 hPa
Humidity: 45 %

Op. Mode	Setup	Port
op-mode 1	Setup_03	Enclosure

a) Determine the total duration of a transmission within 100 ms:

Duty cycle = ((L1*N1) + (L2*N2) + ... + (Ln*Nn)) / 100 ms or T, whichever is less
Correction factor = 20 * LOG (Duty cycle) [dB]

Step 1	Holdover time	Less than 5s
Step 2	Cycle to determine the on/off ratio within 100 ms and Sweep of a sequence to determine the on time within 100 ms (L1-LN).	200.4 ms L1 = 92.2 ms N1 = 8
Step 3	Determine the period of periodic re-transmission	TR = 484.7 ms

Calculation of Duty Cycle / Correction Factor:
If T > 100 ms => T:= 100 ms; L1 = 92.2 ms; N = 1 (within 100 ms);
Duty cycle = (1*92.2) / 100 = 0.92
Correction factor = 20*LOG(0.92) = –0.7 dB

b) Determine the period of periodic re-transmission, if any, or cease (deactivation) time:
Period of re-transmission T_R = 484.7 ms
Deactivation after T_C = 1.69 s, Limit: ≤ 5 s

=> The transmitter operates according to FCC §15.231 (a)(1).

3.2 Spurious radiated emissions

Standard FCC Part 15, 10-1-09 Edition Subpart C

The test was performed according to: FCC §15.31, ANSI C 63.4, 2003

3.2.1 Test Description

The test set-up was made in accordance to the general provisions of ANSI C 63.4-2003. The Equipment Under Test (EUT) was set up on a non-conductive table 1.0 x 2.0 m in the semi-anechoic chamber. The test was performed at the distance of 3 m between the EUT and the receiving antenna.
The radiated emissions measurements were made in a typical installation configuration.
The measurement procedure is implemented into the EMI test software ES-K1 from R&S.

1. Measurement up to 30 MHz
The test set-up was made in accordance to the general provisions of ANSI C 63.4-2003. The Equipment Under Test (EUT) was set up on a non-conductive table in the anechoic chamber.
The radiated emissions measurements were made in a typical installation configuration.
The measurement procedure is implemented into the EMI test software ES-K1 from R&S.
The Loop antenna HFH2-Z2 is used.
Step 1: pre measurement
- Anechoic chamber
- Antenna distance: 10 m
- Detector: Peak-Maxhold
- Frequency range: 0.009 – 0.15 and 0.15 – 30 MHz
- Frequency steps: 0.1 kHz and 5 kHz
- IF–Bandwidth: 0.2 kHz and 10 kHz
- Measuring time / Frequency step: 10 ms

Intention of this step is, to determine the radiated EMI-profile of the EUT. Afterwards the relevant emissions for the final measurement are identified.
Step 2: final measurement
For the relevant emissions determined in step 1, an additional measurement with the following settings will be performed. Intention of this step is to find the maximum emission level.
- Open area test side
- Antenna distance: according to the Standard
- Detector: Quasi-Peak
- Frequency range: 0.009 – 30 MHz
- Frequency steps: measurement at frequencies detected in step 1
- IF–Bandwidth: 200 Hz - 10 kHz
- Measuring time / Frequency step: 100 ms

2. Measurement above 30 MHz and up to 1 GHz
Step 1: Preliminary scan
Preliminary test to identify the highest amplitudes relative to the limit.
Settings for step 1:
- Detector: Peak-Maxhold
- Frequency range: 30 – 1000 MHz
- Frequency steps: 60 kHz
- IF–Bandwidth: 120 kHz
- Measuring time / Frequency step: 100 µs

- Turntable angle range: –180 to 180°
- Turntable step size: 90°
- Height variation range: 1 – 3 m
- Height variation step size: 2 m
- Polarisation: Horizontal + Vertical

Intention of this step is, to determine the radiated EMI-profile of the EUT. Afterwards the relevant emissions for the final measurement are identified.

Step 2: second measurement

For the relevant emissions determined in step 1, an additional measurement with the following settings will be performed. Intention of this step is, to find out the approximate turntable angle and antenna height for each frequency.

- Detector: Peak – Maxhold
- Measured frequencies: in step 1 determined frequencies
- IF – Bandwidth: 120 kHz
- Measuring time: 100 ms
- Turntable angle range: –180 to 180°
- Turntable step size: 45°
- Height variation range: 1 – 4 m
- Height variation step size: 0.5 m
- Polarisation: horizontal + vertical

After this step the EMI test system has determined the following values for each frequency (of step 1):

- Frequency
- Azimuth value (of turntable)
- Antenna height

The last two values have now the following accuracy:

- Azimuth value (of turntable): 45°
- Antenna height: 0.5 m

Step 3: final measurement

In this step the accuracy of the turntable azimuth and antenna height will be improved. This is necessary to find out the maximum value of every frequency.

For each frequency, which was determined the turntable azimuth and antenna height will be adjusted. The turntable azimuth will be slowly varied by +/- 22.5° around this value. During this action the value of emission is continuously measured. The turntable azimuth at the highest emission will be recorded and adjusted. In this position the antenna height is also slowly varied by +/- 25 cm around the antenna height determined. During this action the value of emission is also continuously measured. The antenna height of the highest emission will also be recorded and adjusted.

- Detector: Peak – Maxhold
- Measured frequencies: in step 1 determined frequencies
- IF – Bandwidth: 120 kHz
- Measuring time: 100 ms
- Turntable angle range: –22.5° to + 22.5° around the determined value
- Height variation range: –0.25 m to +0.25 m around the determined value

Step 4: final measurement with QP detector

With the settings determined in step 3, the final measurement will be performed:
EMI receiver settings for step 4:

- Detector: Quasi-Peak(< 1 GHz)
- Measured frequencies: in step 1 determined frequencies
- IF – Bandwidth: 120 kHz
- Measuring time: 1 s

3. Measurement above 1 GHz

The following modifications apply to the measurement procedure for the frequency range above 1 GHz:

The measurement distance was reduced to 1 m. The results were extrapolated by the extrapolation factor of 20 dB/decade (inverse linear distance for field strength measurements, inverse linear-distance squared for the power reference level measurements). Due to the fact that in this frequency range a double ridged wave guided horn antenna (up to 18 GHz) and a horn antenna (18-25 GHz) are used, the steps 2-4 are omitted. Step 1 was performed with one height of the receiving antenna only.

Important EMI receiver settings:

- Detector: Peak
- IF Bandwidth = 1 MHz
- Scantime = 1 ms

3.2.2 Test Requirements / Limits

1) A radiated emission test is relating to the fundamental frequency.

a) Either for “non-periodic” operation of the EUT as defined in §15.231(a) the limits for the average field strength apply according to FCC Part 15, Subpart C, §15.231(b):

For fundamental frequency (MHz)	Limit Fundamental (dBµV/m)	Limit Spurious (dBµV/m)
40.66 – 40.70	67.0	47.0
70 – 130	67.0	47.0
130 – 174	67.0 – 71.5	47.0 – 51.5 *)
174 – 260	71.5	51.5
260 – 470	71.5 – 81.9	51.5 – 61.9 *)
above 470	81.9	61.9

b) Or for “periodic” operation of the EUT the limits for the average field strength apply according to FCC Part 15, Subpart C, §15.231(e):

For fundamental frequency (MHz)	Limit Fundamental (dBµV/m)	Limit Spurious (dBµV/m)
40.66 – 40.70	60.0	40.0
70 – 130	54.0	34.0
130 – 174	54.0 – 63.5	34.0 – 43.5 *)
174 – 260	63.5	43.5
260 – 470	63.5 – 74.0	43.5 – 54.0 *)
above 470	74.0	54.0

*) linear interpolation

2) A radiated emission test applies to harmonic/spurs that fall in the restricted bands as listed in § 15.205(a). The maximum permitted QP (< 1 GHz) and Average (> 1GHz) field strength is listed in § 15.209(a):
Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

Frequency in MHz	Limit (µV/m)	Measurement distance (m)	Calculate Limit(dBµV/m @10m)	Limit (dBµV/m) @10m
0.009 – 0.49	2400/F (kHz)	300	(48.5 – 13.8) + 30 dB	78.5 – 46.8
0.49 – 1.705	24000/F (kHz)	30	(48.9 – 23.0) + 10 dB	58.9 – 33.0
1.705 – 30	30	30	29.5 + 10 dB	39.5

Frequency in MHz	Limit (µV/m)	Measurement distance (m)	Limit (dBµV/m
30 – 88	100	3	40.0
88 – 216	150	3	43.5
216 – 960	200	3	46.0
above 960	500	3	54.0

§15.35(b) ..., there is also a limit on the radio frequency emissions, as measured using instrumentation with a peak detector function, corresponding to 20 dB above the maximum permitted average limit ... .

Used conversion factor: Limit (dBµV/m) = 20 log (Limit (µV/m)/1µV/m)

§15.35(c):
[...] when the radiated emission limits are expressed in terms of the average value of the emission, and pulsed operation is employed, the measurement field strength shall be determined by averaging over one complete pulse train, including blanking intervals, as long as the pulse train does not exceed 0.1 seconds.
As an alternative (provided the transmitter operates for longer than 0.1 seconds) or in cases where the pulse train exceeds 0.1 seconds, the measured field strength shall be determined from the average absolute voltage during a 0.1 second interval during which the field strength is at its maximum value. The exact method of calculating the average field strength shall be submitted [...].

§15.231(b)(3)
The limits on the field strength of the spurious emissions in the above table are based on the fundamental frequency of the intentional radiator.
Spurious emissions shall be attenuated to the average (or, alternatively, CISPR quasi-peak) limits shown in this table or to the general limits shown in §15.209, whichever limit permits a higher field strength.

Interpretation of the test laboratory:
The last subordinate clause of §15.231(b)(3) is overruled by §15.205/209, therefore within the restricted bands the limits defined at §15.205/209 and outside the restricted bands the limits defined at §15.231(b) resp. §15.231(e) are applied.

3.2.3 Test Protocol

The EUT is transmitting alternating on 2 channels (314.6 and 315.0 MHz). It is checked that the maximum output power is generated on channel 1 and the tests “output power / radiated spurious emissions” in test mode are performed for this channel.

3.2.3.1 Measurement up to 30 MHz

Because of the kind of EUT, especially the size, which is small related to the wavelength (1/100 lambda), no relevant emissions are expected in the frequency range 9 kHz to 30 MHz (theoretically not possible). Nevertheless a check using a near field probe was performed. No relevant emissions have been observed. Consequently no final measurement was performed.

3.2.3.2 Measurement 30 MHz – 1 GHz (setup_01), 300 – 700 MHz (setup_02)

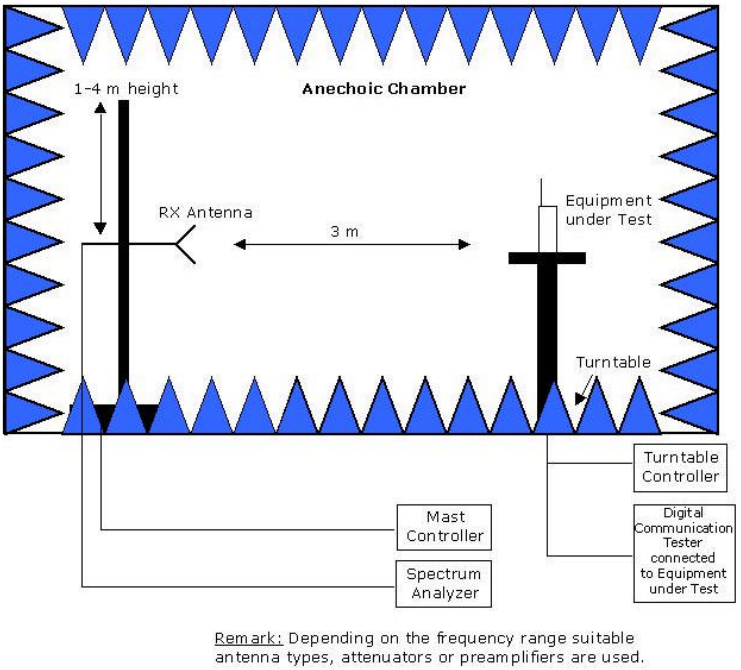
5 Photo Report

Detailed photos of the OUT are declared as confidential.

The photos are included in a separate report.

6 Setup Drawings



Drawing 1: Setup in the Anechoic chamber. For measurements below 1 GHz the ground was replaced by a conducting ground plane.

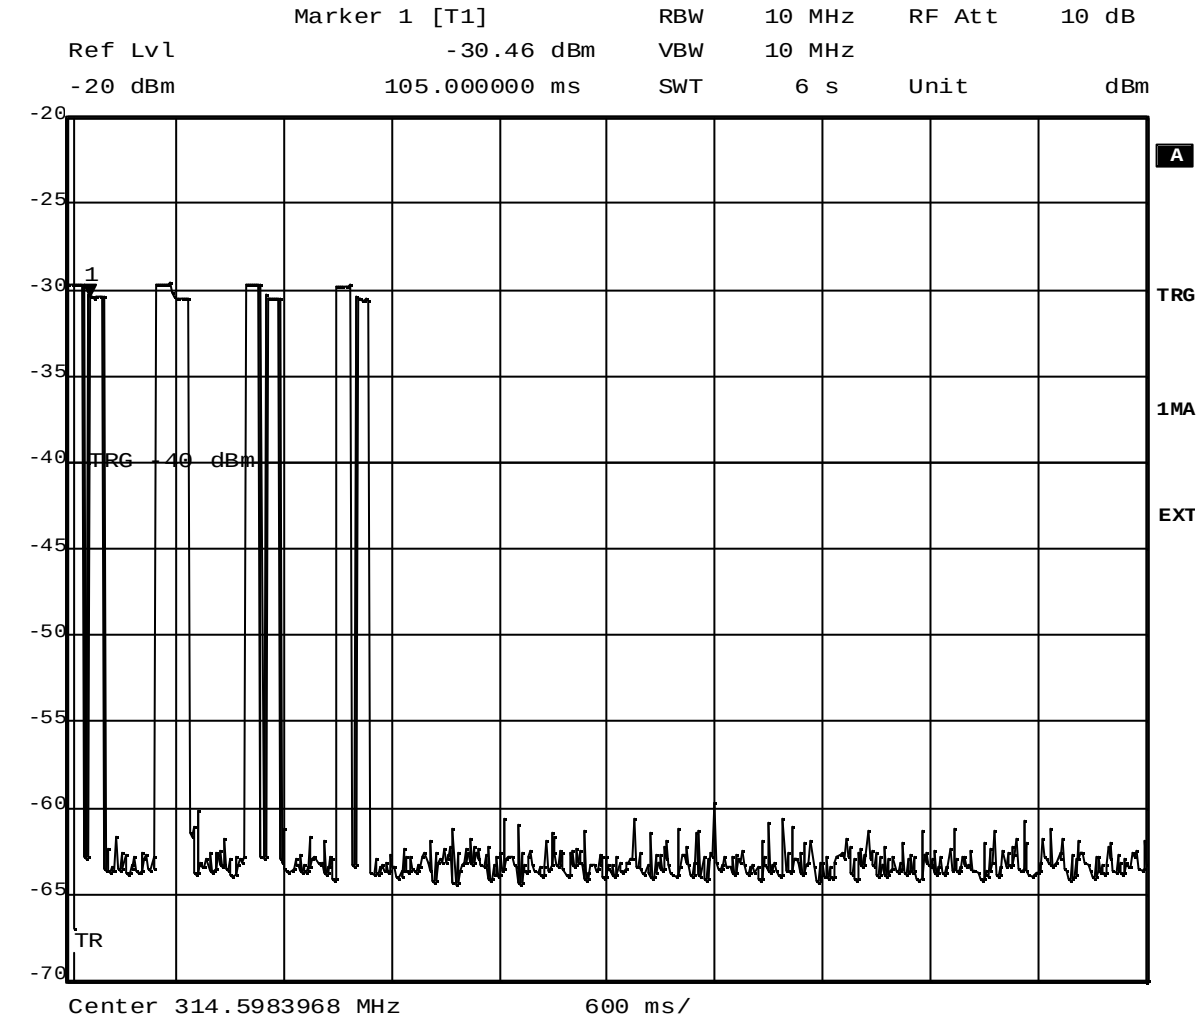
7 Annex measurement plots

7.1 Duty cycle measurement (based on dwell time measurement)

Op. Mode

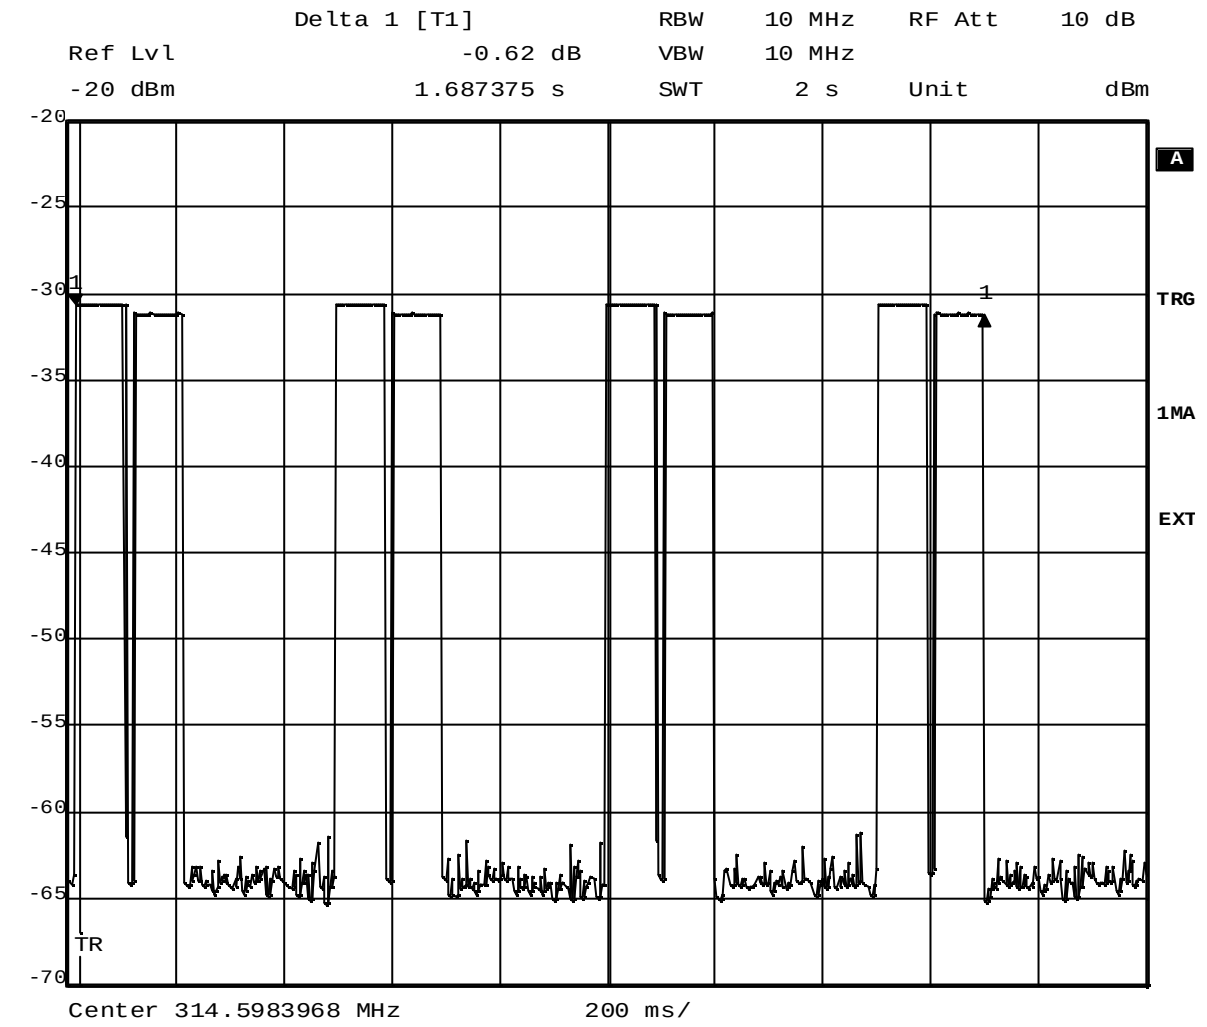
Op- mode 1

The duty cycle is checked for each of the three buttons and found to be identical. Shown are results for the button “padlock”.



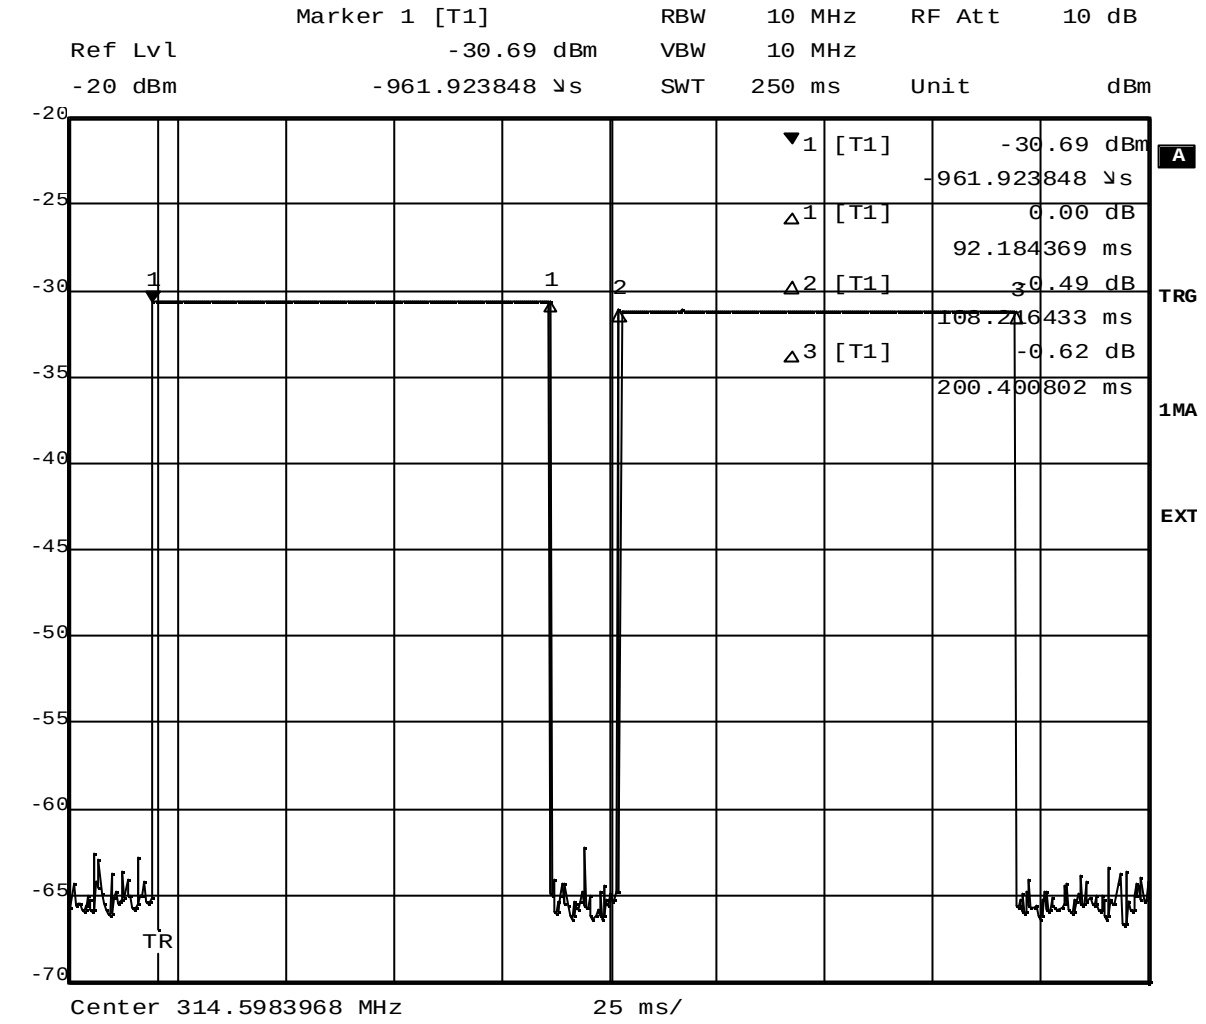
Date: 16.AUG.2010 16:02:53

Step 1a: Holdover time, T_C > 5 s



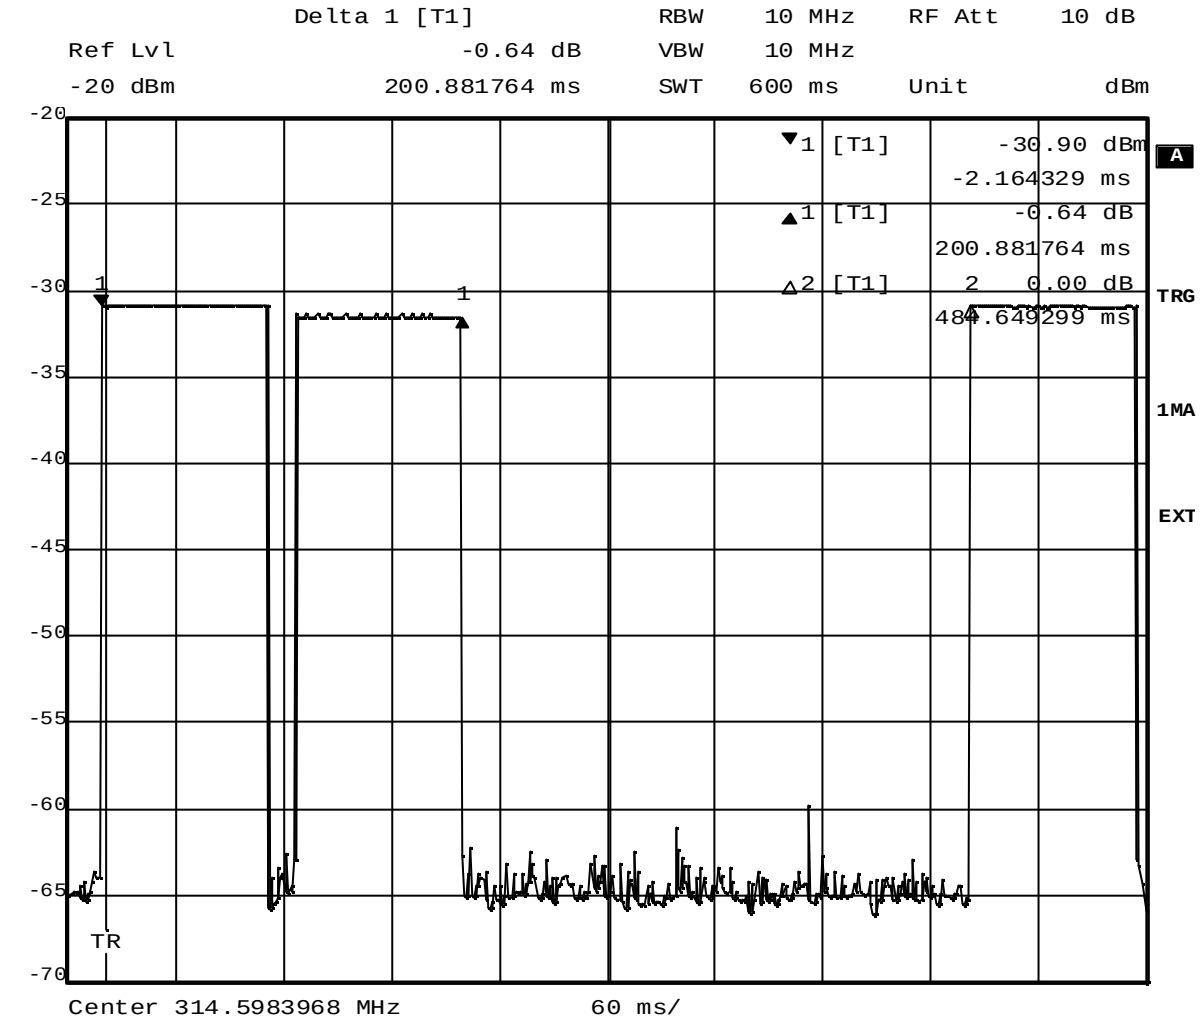
Date: 16.AUG.2010 16:08:18

Step 1b: Holdover time, determined as T_C = 1.69 s



Date: 16.AUG.2010 16:11:09

Step 2: 250 ms sweep, cycle to determine the on/off ratio within 100 ms



Date: 16.AUG.2010 16:13:54

Step 3: Determine the period of periodic re-transmission
