## We hereby certify that:

The above equipment was tested by Compliance Certification Services Inc. The test data, data evaluation, test procedures, and equipment configurations shown in this report were made in accordance with the procedures given in ANSI C63.4: 2003 and the energy emitted by the sample EUT tested as described in this report is in compliance with conducted and radiated emission limits of FCC Rules Part 15.207, 15.209 and 15.247.

The test results of this report relate only to the tested sample EUT identified in this report.

Note: This submittal(s) (test report) is intended for FCC ID: YH5HSWICTR filing to comply with Section 15.207, 15.209 and 15.247 of the FCC Part 15, Subpart C Rules.

## 3. TEST METHODOLOGY

#### 3.1 DESCRIPTION OF TEST MODES

The EUT has been tested under operating condition.

Test program used to control the EUT for staying in continuous transmitting and receiving mode is programmed.

The following test mode(s) were scanned during the preliminary test below 1G:

|                    | 0 1   |     |            |
|--------------------|---|-----|------------|
| Test Item          | Test mode   |     | Worse mode |
| Conducted Emission | Not applicable since the supplied by the battery. | EUT |            |
| Radiated Emission  | Mode 1: Normal Link                               |     | •          |

Above 1G, Channel Low (2402MHz) \( \) Mid (2441MHz) and High (2480MHz) were chosen for full testing for GFSK.

The field strength of spurious radiation emission was measured in the following position: EUT stand-up position (Y mode) and lie-down position (X, Z mode) The following data show only the worst case setup.

The worst case (X axis) was reported.

## 4. FACILITIES AND ACCREDITATIONS

#### 4.1 FACILITIES

All measurement facilities used to collect the measurement data are located at No10-1, Mingkeda Logistics Park, No.18 Huanguan South RD. Guan Ian Town, Baoan District, Shenzhen China

Report No: SZ100722B02-RP

The sites are constructed in conformance with the requirements of ANSI C63.4:2003, ANSI C63.7 and CISPR Publication 22. All receiving equipment conforms to CISPR Publication 16-1, "Radio Interference Measuring Apparatus and Measurement Methods."

#### 4.2 ACCREDITATIONS

Our laboratories are accredited and approved by the following accreditation body according to ISO/IEC 17025.

USA A2LA Taiwan TAF

The measuring facility of laboratories has been authorized or registered by the following approval agencies.

USA FCC
Japan VCCI
Canada INDUSTRY CANADA
Taiwan BSMI
Norway Nemko

Copies of granted accreditation certificates are available for downloading from our web site, <a href="http://www.ccsrf.com">http://www.ccsrf.com</a>

#### 4.3 MEASUREMENT UNCERTAINTY

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the EUT as specified in CISPR 16-4-2:

| Measurement         | Frequency       | Uncertainty |
|---------------------|-----------------|-------------|
| Conducted emissions | 9kHz~30MHz      | +/- 3.18dB  |
|                     | 30MHz ~ 200MHz  | +/- 3.79dB  |
| Radiated emissions  | 200MHz ~1000MHz | +/- 3.62dB  |
|                     | Above 1000MHz   | +/- 5.04dB  |

This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of k=2.

The measured result is above (below) the specification limit by a margin less than the measurement uncertainty; it is therefore not possible to state compliance based on the 95% level of confidence. However, the result indicates that compliance (non-compliance) is more probable than non-compliance) with the specification limit.

## 5. SETUP OF EQUIPMENT UNDER TEST

#### 5.1 SETUP CONFIGURATION OF EUT

See test photographs attached in Appendix 1 for the actual connections between EUT and support equipment.

#### 5.2 SUPPORT EQUIPMENT

| No.  | Equipment       | Model No. | Serial No.   | FCC ID  | Trade Name | Data Cable                    | Power Cord   |

| 3.   | Game bar        | RVL-004   | N/A          | FCC DoC | NINTENDO   | Unshielded,0.90m              | Unshielded,0.90m   |
| 4.   | Will Sensor bar | RVL-014   | N/A          | FCC DoC | NINTENDO   | Unshielded,3.00m              | N/A  |

#### Notes:

- 1. All the equipment/cables were placed in the worst-case configuration to maximize the emission during the test.
- 2. Grounding was established in accordance with the manufacturer's requirements and conditions for the intended use.

## 6. FCC PART 15.247 REQUIREMENTS

#### 6.1 20DB BANDWIDTH

None; for reporting purpose only.

#### MEASUREMENT EQUIPMENT USED

| Name of<br>Equipment | Manufacturer | Model  | Serial<br>Number | Last<br>Calibration | Due<br>Calibration |
|----------------------|--------------|--------|------------------|---------------------|--------------------|
| Spectrum Analyzer    | Agilent      | E4446A | US44300399       | 03/21/2010          | 03/21/2011         |

Report No: SZ100722B02-RP

Remark: Each piece of equipment is scheduled for calibration once a year.

### **TEST CONFIGURATION**

## **TEST PROCEDURE**

- 1. Place the EUT on the table and set it in the transmitting mode.
- 2. Remove the antenna from the EUT, then connect a low loss RF cable from antenna port to the

spectrum analyzer.

- 3. Set the spectrum analyzer as RBW=30kHz, VBW=30kHz, Span=3MHz, Sweep = auto.
- 4. Mark the peak frequency and 20dB (upper and lower) frequency.
- 5. Repeat until all the test channels are investigated.

## **TEST RESULTS**

No non-compliance noted

#### **Test plot**

#### **GFSK**

### 20dB Bandwidth (CH Low)

Transmit Freq Error -33.862 kHz x dB Bandwidth 959.288 kHz

#### 20dB Bandwidth (CH Mid)

Transmit Freq Error -32.318 kHz x dB Bandwidth 950.672 kHz

## 20dB Bandwidth (CH High)

Transmit Freg Error -31.191 kHz x dB Bandwidth 959.761 kHz

#### 6.2 PEAK POWER

## **LIMIT**

The maximum peak output power of the intentional radiator shall not exceed the following:

Report No: SZ100722B02-RP

- 1. For frequency hopping systems operating in the 2400-2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725-5850 MHz band: 1 watt. For all other frequency hopping systems in the 2400-2483.5 MHz band: 0.125 watts.
- 2. Except as shown in paragraphs (b)(3) (i), (ii) and (iii) of this section, if transmitting antennas of directional gain greater than 6dBi are used the peak output power from the intentional radiator shall be reduced below the stated values in paragraphs (b)(1) or (b)(2) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6dBi.
- 3. The conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6 dBi. Except as shown in paragraph (c) of this section, if transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced below the stated values in paragraphs (b)(1), (b)(2), and (b)(3) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

## MEASUREMENT EQUIPMENT USED

| Name of Equipment       | Manufacturer | Model   | Serial<br>Number | Last Calibration | Due<br>Calibration |
|-------------------------|--------------|---------|------------------|------------------|--------------------|
| RF Power Meter & Sensor | Anritsu      | ML2487A | 6K00001491       | 02/23/2010       | 02/23/2011         |
| Spectrum Analyzer       | Agilent      | E4446A  | US44300399       | 03/21/2010       | 03/21/2011         |

**Remark:** Each piece of equipment is scheduled for calibration once a year.

#### **Test Configuration**

### **TEST PROCEDURE**

The transmitter output is connected to the RF Power Meter. The RF Power Meter is set to the peak power detection.

# **TEST RESULTS**

No non-compliance noted

**Test Data** 

## **GFSK**

| Channel | Frequency<br>(MHz) | Reading Power (dBm) | Factor (dB) | Otput Power<br>(dBm) | Otput Power<br>(W) | Limit<br>(mW) | Result |

#### 6.3 PEAK POWER SPECTRAL DENSITY

## LIMIT

 For direct sequence systems, the peak power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8dBm in any 3kHz band during any time interval of continuous transmission.

Report No: SZ100722B02-RP

2. The direct sequence operating of the hybrid system, with the frequency hopping operation turned off, shall comply with the power density requirements of paragraph (d) of this section.

### MEASUREMENT EQUIPMENT USED

| Name of Equipment | Manufacturer | Model  | Serial<br>Number | Last<br>Calibration | Due<br>Calibration |
|-------------------|--------------|--------|------------------|---------------------|--------------------|
| Spectrum Analyzer | Agilent      | E4446A | US44300399       | 03/21/2010          | 03/21/2011         |

Remark: Each piece of equipment is scheduled for calibration once a year.

#### **Test Configuration**

## **TEST PROCEDURE**

- 1. Place the EUT on the table and set it in transmitting mode.
- 2. Remove the antenna from the EUT and then connect a low loss RF cable from the antenna port to the spectrum analyzer.
- Set the spectrum analyzer as RBW = 3kHz, VBW = 10kHz, Span = 300kHz, Sweep=100s
- 4. Record the max. reading.
- 5. Repeat the above procedure until the measurements for all frequencies are completed.

## **TEST RESULTS**

Not applicable. Since EUT is the Bluetooth device.

#### 6.4 BAND EDGES MEASUREMENT

## **LIMIT**

According to §15.247(c), in any 100 kHz bandwidth outside the frequency bands in which the spread spectrum intentional radiator in operating, the radio frequency power that is produced by the intentional radiator shall be at least 20dB below that in the 100kHz bandwidth within the band that contains the highest level of the desired power, In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in15.209(a).

## **Test Configuration**

## **TEST PROCEDURE**

- 1. The EUT is placed on a turntable, which is 0.8m above the ground plane.
- 2. The turntable shall be rotated for 360 degrees to determine the position of maximum emission level.
- 3. EUT is set 3m away from the receiving antenna, which is varied from 1m to 4m to find out the highest emission.
- 4. Set the spectrum analyzer in the following setting in order to capture the lower and upper band-edges of the emission:
  - (a) PEAK: RBW=VBW=1MHz / Sweep=AUTO
  - (b) AVERAGE: RBW=1MHz / VBW=10Hz / Sweep=AUTO
- 5. Repeat the procedures until all the PEAK and AVERAGE versus POLARIZATION are measured.

#### **TEST RESULTS**

Refer to attach spectrum analyzer data chart.

#### 6.5 FREQUENCY SEPARATION

#### LIMIT

According to §15.247(a)(1), Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW.

Report No: SZ100722B02-RP

### MEASUREMENT EQUIPMENT USED

| Name of<br>Equipment | Manufacturer | Model  | Serial Number | Last<br>Calibration | Due<br>Calibration |
|----------------------|--------------|--------|---------------|---------------------|--------------------|
| Spectrum Analyzer    | Agilent      | E4446A | US44300399    | 03/21/2010          | 03/21/2011         |
| Spectrum Analyzer    | R&S          | FSP30  | 1093.4495.30  | 07/22/2010          | 07/22/2011         |

**Remark:** Each piece of equipment is scheduled for calibration once a year.

#### **Test Configuration**

## **TEST PROCEDURE**

- 1. Place the EUT on the table and set it in transmitting mode.
- 2. Remove the antenna from the EUT and then connect a low loss RF cable from the antenna port to the spectrum analyzer.
- 3. Set center frequency of spectrum analyzer = middle of hopping channel.
- 4. Set the spectrum analyzer as RBW=30kHz, VBW=30kHz, Adjust Span to 3 MHz, Sweep = auto.
- 5. Max hold. Mark 3 Peaks of hopping channel and record the 3 peaks frequency.

#### 6.8 SPURIOUS EMISSIONS

#### 6.8.1. Conducted Measurement

## LIMIT

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement. Attenuation below the general limits specified in Section 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c)).

## **MEASUREMENT EQUIPMENT USED**

| Name of Equipment | Manufacturer | Model  | Serial Number | Last<br>Calibration | Due<br>Calibration |
|-------------------|--------------|--------|---------------|---------------------|--------------------|
| Spectrum Analyzer | Agilent      | E4446A | US44300399    | 03/21/2010          | 03/21/2011         |

Remark: Each piece of equipment is scheduled for calibration once a year.

#### **Test Configuration**

## **TEST PROCEDURE**

Conducted RF measurements of the transmitter output were made to confirm that the EUT antenna port conducted emissions meet the specified limit and to identify any spurious signals that require further investigation or measurements on the radiated emissions site.

The transmitter output is connected to the spectrum analyzer. The resolution bandwidth is set to 100 KHz. The video bandwidth is set to 100 KHz.

Measurements are made over the 30MHz to 26GHzrange with the transmitter set to the lowest, middle, and highest channels.

### 6.8.2. Radiated Emissions

#### LIMIT

1. Except as provided elsewhere in this Subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

| Frequency (MHz) | Field Strength (mV/m) | Measurement Distance (m) |
|-----------------|-----------------------|--------------------------|
| 30-88           | 100*                  | 3                        |
| 88-216          | 150*                  | 3                        |
| 216-960         | 200*                  | 3                        |
| Above 960       | 500                   | 3                        |

Report No: SZ100722B02-RP

**Note:** Except as provided in paragraph (g), fundamental emissions from intentional radiators operating under this Section shall not be located in the frequency bands 54-72 MHz, 76-88 MHz, 174-216 MHz or 470-806 MHz. However, operation within these frequency bands is permitted under other sections of this Part, e.g., Sections 15.231 and 15.241.

2. In the above emission table, the tighter limit applies at the band edges.

| Frequency (Hz) | Field Strength<br>(µV/m at 3-meter) | Field Strength<br>(dBµV/m at 3-meter) |
|----------------|-------------------------------------|---------------------------------------|
| 30-88          | 100                                 | 40                                    |

#### **Test Configuration**

#### **Below 1 GHz**

#### **Above 1 GHz**

#### **TEST PROCEDURE**

- 1. The EUT is placed on a turntable, which is 0.8m above ground plane.
- 2. The turntable shall be rotated for 360 degrees to determine the position of maximum emission level.
- 3. EUT is set 3m away from the receiving antenna, which is varied from 1m to 4m to find out the highest emissions.
- 4. Maximum procedure was performed on the six highest emissions to ensure EUT compliance.
- 5. And also, each emission was to be maximized by changing the polarization of receiving antenna both horizontal and vertical.
- 6. Repeat above procedures until the measurements for all frequencies are complete.

<sup>\*\*</sup>Remark: No emission found between lowest internal used/generated frequency to 30 MHz.

- 1. Measuring frequencies from 9kHz to the 1GHz.
- 2. Radiated emissions measured in frequency range from 30MHz to 1GHz were made with an instrument using Peak/Quasi-peak detector mode.
- 3. Data of measurement within this frequency range shown "---" in the table above means the reading of emissions are attenuated more than 20dB below the permissible limits or the field strength is too small to be measured.
- 4. The IF bandwidth of SPA between 30MHz to 1GHz was 100kHz.

- 1. Measuring frequencies from 1 GHz to the 10th harmonic of highest fundamental frequency.
- 2. Measurements above show only up to 6 maximum emissions noted, or would be lesser if no specific emissions from the EUT are recorded (ie: margin>20dB from the applicable limit) and considered that's already beyond the background noise floor.
- 3. Radiated emissions measured in frequency above 1000MHz were made with an instrument using Peak detector mode and average detector mode of the emission shown in Actual FS column.
- 4. Spectrum setting:
  - a. Peak Setting 1GHz 26GHz, RBW = 1MHz, VBW = 1MHz, Sweep time = 200 ms.
  - b. AV Setting 1GH z- 26GHz, RBW = 1MHz, VBW = 10Hz, Sweep time = 200 ms.

#### 6.9 POWERLINE CONDUCTED EMISSIONS

#### LIMIT

For an intentional radiator which is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed 250 microvolts (The limit decreases linearly with the logarithm of the frequency in the range 0.15 MHz to 0.50 MHz). The limits at specific frequency range is listed as follows:

| Fraguancy Pango (MUz) | Limits     | (dBµV)   |
|-----------------------|------------|----------|
| Frequency Range (MHz) | Quasi-peak | Average  |
| 0.15 to 0.50          | 66 to 56   | 56 to 46 |
| 0.50 to 5             | 56         | 46       |
| 5 to 30               | 60         | 50       |

Compliance with this provision shall be based on the measurement of the radio frequency voltage between each power line (LINE and NEUTRAL) and ground at the power terminals.

**Remark:** Each piece of equipment is scheduled for calibration once a year.

### **Test Configuration**

See test photographs attached in Appendix 1 for the actual connections between EUT and support equipment.

#### **TEST PROCEDURE**

- 1. The EUT was placed on a table, which is 0.8m above ground plane.
- 2. Maximum procedure was performed on the six highest emissions to ensure EUT compliance.
- 3. Repeat above procedures until all frequency measured were complete.

#### **TEST RESULTS**

The initial step in collecting conducted data is a spectrum analyzer peak scan of the measurement range. Significant peaks are then marked as shown on the following data page, and these signals are then quasi-peaked.

#### **Test Data**

Not applicable since the EUT supplied by the battery.

# 7. ANNEX DECLARATION FOR BLUETOOTH DEVICE ACC to Part 15.247

# 1 Output power and channel separation of a Bluetooth device in the different operating modes:

The different operating modes (data-mode, acquisition-mode) of a Bluetooth devicehas no influence on the output power and the channel spacing. There is only one transmitter which is driven by identical input parameters concerning these two parameters. Only a different hopping sequence will be used. For this reason the check of these

RF parameters in one op-mode is sufficient.

#### 2 Frequency range of a Bluetooth device:

Hereby we declare that the maximum frequency of this device is: 2402 – 2480 MHz. This is according to the Bluetooth Core Specification (+ critical errata) for devices which will be operated in the USA. This was checked during the Bluetooth Qualification tests (Test Case: TRM/CA/04E). Other frequency ranges (e.g. for Spain, France, Japan) which are allowed according the Core Specification are not supported by this device.

## 3 Co-ordination of the hopping sequence in data mode to avoid simultaneous occupancy by multiple transmitters:

Bluetooth units which want to communicate with other units must be organised in astructure called piconet. This piconet consist of max. 8 Bluetooth units. One unit is the master the other seven are the slaves. The master co-ordinates frequency occupation in this piconet for all units. As the master hop sequence is derived from its BD address which is unique for each Bluetooth device, additional masters intending to establish new piconets will always use different hop sequences.

#### 4 Example of a hopping sequence in data mode:

Example of a 79 hopping sequence in data mode:40, 21, 44, 23, 42, 53, 46, 55, 48, 33, 52, 35, 50, 65, 54, 67, 56, 37, 60, 39, 58, 69, 62, 71, 64, 25, 68, 27, 66, 57, 70, 59, 72, 29, 76, 31, 74, 61, 78, 63, 01, 41, 05, 43, 03, 73, 07, 75, 09, 45, 13, 47, 11, 77, 15, 00, 64, 49, 66, 53, 68, 02, 70, 06, 01, 51, 03, 55, 05, 04

### 5 Equally average use of frequencies in data mode and behaviour for short transmissions:

The generation of the hopping sequence in connection mode depends essentially on two input values:

- 1. LAP/UAP of the master of the connection
- 2. Internal master clock

The LAP (lower address part) are the 24 LSB's of the 48 BD\_ADDRESS. The BD\_ADDRESS is an unambiguous number of every Bluetooth unit. The UAP (upper address part) are the 24 MSB's of the 48 BD ADDRESS.

The internal clock of a Bluetooth unit is derived from a free running clock which is never adjusted and is never turned off. For synchronisation with other units onlyoffset are used. It has no relation to the time of the day. Its resolution is at least half the RX/TX slot length of 312.5 µs. The clock has a cycle of about one day (23h30).In most case it is implemented as 28 bit counter. For the deriving of the hopping sequence the entireLAP (24 bits), 4 LSB's (4 bits) (Input 1) and the 27 MSB's of the clock (Input 2) are used. With this input values different mathematical procedures (permutations, additions, XOR-operations) are performed to generate the sequence. This will be done at the beginning of every new transmission.

Regarding short transmissions the Bluetooth system has the following behaviour: The first connection between the two devices is established, a hopping sequence was generated. For transmitting the wanted data the complete hopping sequencewas not used. The connection ended. The second connection will be established. A new hopping sequence is generated. Due to the fact that the Bluetooth clock has a different value, because the periodbetween the two transmission is longer (and it cannot be shorter) than the minimum resolution of the clock (312.5  $\mu$ s). The hopping sequence will always differ from the first one.

# 6 Receiver input bandwidth and behaviour for repeated single or multiple packets:

The input bandwidth of the receiver is 1 MHz. In every connection one Bluetooth device is the master and the other one is the slave. The master determines the hopping sequence (see chapter 5). The slave follows this sequence. Both devices

shift between RX and TX time slot according to the clock of the master. Additionally the type of connection (e.g. single or multislot packet) is set up at the beginning of the connection. The master adapts its hopping frequency and itsTX/RX timing according to the packet type of the connection. Also the slave of the connection will use these settings. Repeating of a packet has no influence on the hopping sequence. The hopping sequence generated by the master of the connection will be followed in any case. That means, a repeated packet will not be send on the same frequency, it is send on the next frequency of the hopping sequence.

#### 7 Dwell time in data mode

The dwell time of 0.3797s within a 30 second period in data mode is independent from the packet type (packet length). The calculation for a 30 second period is a follows:

Dwell time = time slot length \* hop rate / number of hopping channels \*30s

Example for a DH1 packet (with a maximum length of one time slot) Dwell time =625  $\mu$ s \* 1600 1/s / 79 \* 30s = 0.3797s (in a 30s period)

For multislot packet the hopping is reduced according to the length of the packet. Example for a DH5 packet (with a maximum length of five time slots) Dwell time =  $5 * 625 \mu s * 1600 * 1/5 * 1/s / 79 * 30s = 0.3797s$  (in a 30s period).

This is according the Bluetooth Core Specification V 1.0B (+ critical errata) for all Bluetooth devices. Therefor all Bluetooth devices comply with the FCC dwell time requirement in data mode. This was checked during the Bluetooth Qualification tests. The Dwell time in hybrid mode is measured and stated in the test report.

#### 8 Channel Separation in hybrid mode

The nominal channel spacing of the Bluetooth system is 1Mhz independent of the operating mode. The maximum "initial carrier frequency tolerance" which is allowed for Bluetooth is fcenter = 75 kHz. This was checked during the Bluetooth Qualification tests (Test Case: TRM/CA/07E) for three frequencies (2402, 2441, 2480 MHz). Additionally an example for the channel separation is given in the test report

#### 9 Derivation and examples for a hopping sequence in hybrid mode

For the generation of the inquiry and page hop sequences the same procedures as described for the data mode are used (see chapter 5), but this time with differentinput vectors:

- For the inquiry hop sequence, a predefined fixed address is always used. This results in the same 32 frequencies used by all devices doing an inquiry but every time with a different start frequency and phase in this sequence.
- For the page hop sequence, the device address of the paged unit is used as input vector. This results in the use of a subset of 32 frequencies which is specificfor that initial state of the connection establishment between the two units. A page to different devices would result in a different subset of 32 frequencies.

So it is ensured that also in hybrid mode the frequency use equally averaged.

Example of a hopping sequence in inquiry mode:48, 50, 09, 13, 52, 54,41, 45, 56, 58, 11, 15, 60, 62, 43, 47, 00, 02, 64, 68, 04, 06, 17, 21, 08, 10, 66, 70, 12, 14, 19, 23

Example of a hopping sequence in paging mode:08, 57, 68, 70, 51, 02, 42, 40, 04, 61, 44, 46, 63, 14, 50, 48, 16, 65, 52, 54, 67, 18, 58, 56, 20, 53, 60, 62, 55, 06, 66, 64

#### 10 Receiver input bandwidth and synchronisation in hybrid mode:

The receiver input bandwidth is the same as in the data mode (1 MHz). When two Bluetooth devices establish contact for the first time, one device sends an inquiry access code, the other device is scanning for this inquiry access code. If twodevices have been connected previously and want to start a new transmission, asimilar procedure takes place. The only difference is, instead of the inquiry access code, an special access code, derived from the BD\_ADDRESS of the paged devicewill be, will be sent by the master of this connection. Due to the fact that both units have been connected before (in the inquiry procedure) the paging unit has timing and frequency information about the page scan of thepaged unit. For this reason the time to establish the connection is reduced considerable.

#### 11 Spread rate / data rate of the direct sequence signal

The Spread rate / Data rate in inquiry and paging mode can be defined via the access code. The access code is the only criterion for the system to check if there is a valid transmission or not. If you regard the presence of a valid access code as one bit of information, and compare it with the length of the access code of 68 bits, the Spread rate/ Data rate will be 68/1.

#### 12 Spurious emission in hybrid mode

The dwell time in hybrid mode is shorter than in data mode. For this reason the spurious emissions average level in data mode is worst case. The spurious emissions peak level is the same for both modes.

#### 13 Peak power spectral density measurement

Since the transmitter is only active for some milliseconds on one channel you would get a result with many interruptions if using a sweep time of e.g. 1s as stated in the FCC rules. Therefore a fast sweep in maxhold function is used instead and the EUT is activated several times until the measurement curve has stabilized.
