

## The Description of R6 Circuit

R6 is a remote control. The DC/DC module it uses transmits the voltage from 12v to 3.3v to make U2 work. When you operate “ALARM”, “ON” and “OFF”, you actually touch off U2 and send out the order. The code gives out a 8-part data; they are filtered by 433 MHz filter, enlarged by U3 and lastly sent out by antenna.
