Chapter 1: Introduction

Product Overview

Thank you for choosing FWR-634N Wireless N Router.

FWR-634N 150Mbps Wireless N Router is an all-in-one router, ideal for home and SOHO users to share broadband Internet connection over the wired and wireless network. With the speed of up to 150Mbps, it can provide users with extraordinary smooth internet surfing, internet phone calling, and on-line gaming. Moreover, by adopting built-in antenna, FWR-634N could greatly increases the wireless range & sensitivity, which enables you to receive wireless signals in the farthest corner of your home or office. And you can quickly setup the security at a simple push of the WPS (WiFi Protected Setup) button on the fashionable designed router, preventing your device from potential internet attacks.

Front Panel

Power LED

The Power LED lights up when the Router is powered on. When the Router goes through its self-diagnostic mode during every boot-up, the LED flashes. When the diagnostic is complete, the LED is continuously lit.

WLAN LED

The Wireless LED lights up when the wireless feature is enabled. It flashes when the Router sends or receives data over the wireless network.

Wi-Fi Protected Setup (WPS) LED

If you have client devices, such as wireless adapters, that support Wi-Fi Protected Setup, then you can use the Wi-Fi Protected Setup button to automatically configure wireless security for your wireless network. To use Wi-Fi Protected Setup, refer to the section of Wi-Fi Protected Setup.

WAN LED

The Internet LED lights up when there is a connection made through the Internet port. It flashes to indicate network activity over the Internet port.

LED (1-4)

These LEDs are corresponding with the LAN ports on the rear panel. The LED is continuously lit when the Router is connected to a device through that port. It flashes to indicate network activity over that port.

Power LED: The Power LED lights up when the Router is powered on. When the Router goes through its self-diagnostic mode during every boot-up, the LED flashes. When the diagnostic is complete, the LED is continuously lit.

WLAN LED: The Wireless LED lights up when the wireless feature is enabled. It flashes when the Router sends or receives data over the wireless network.

Wi-Fi Protected Setup (WPS) LED: If you have client devices (such as wireless adapters) that support Wi-Fi Protected Setup, then you can use the Wi-Fi Protected Setup button to automatically configure wireless security for your wireless network. To use Wi-Fi Protected Setup, refer to the section of **Wi-Fi Protected Setup**.

WAN: The WAN LED lights up when there is a connection made through the WAN port. It flashes to indicate network activity over the WAN port.

LED (1~4): These LEDs are corresponding with the LAN ports on the rear panel. The LED is continuously lit when the Router is connected to a device through that port. It flashes to indicate network activity over that port.

LED	Status	Description
DOWED	On	Power is on
POWER	Off	Power is off
	On	The wireless function is enabled
WLAN	Off	The wireless function is disabled
	Blinking	Sending or receiving data over wireless network
	Off	WPS function is disabled
WPS	Blinking	A wireless device is connecting to the network by WPS function. This process will last in the first 2 minutes
	On	A wireless device has been successfully connected to the network by WPS function
	On	WAN port is connected
WAN	Off	WAN port is unconnected
	Blinking	Data is transmitting
LAN	On	LAN port is connected
	Off	LAN port is unconnected
(FUIL 1-4)	Blinking	Data is transmitting

Rear Panel

PHICOMM

www.phicomm.com

WPS: Press the button and the WPS LED in front panel flashing, WPS function is enabled.

Reset: Long press and hold the button for 8 seconds, the Router will reboot to its factory default settings.

WAN: Using an Ethernet cable (also called a network or Internet cable), the Internet port connects the Router to your Internet connection, which is typically a cable or Digital Subscriber Line (DSL) modem.

LAN (1~4): Using Ethernet cables, these Ethernet ports (4, 3, 2, 1) connect the Router to computers and other Ethernet network devices on your wired network.

Power: The Power port connects to the included power adapter.

ON/OFF: The power on/off button.

Main Features

- 4 LAN ports and 1 WAN port
- Wireless N speed up to 150Mbps, ideal for internet surfing and on-line gaming
- Multi-SSID allows users to create multiple networks, and distributes access privilege of each network
- QoS controls the reasonable allocation of bandwidth to achieve optimum utilization, ensuring reliable Internet connection
- Quick wireless security setup by simply pressing the WPS button
- WDS wireless bridge provides seamless bridging to expand your wireless network
- Built-in firewall featured with IP, MAC, URL filtering and ARP attack prevention to protect your PC
- Backward compatible with 802.11b/g product
- Setup wizard simplifies installation and configuration

Chapter 2: Installation

Physical Connection

Note:

- Actual product may be different as the picture, but the installation will be the same.
- Please use the included power adapter. Use of a different power adapter could cause damage and void the warranty for this product.
- Please ensure the **Power, LAN** and **WAN** lights are ON when the installation finished successfully.

Configure the Computers IP Address

After connecting your PC to the router, you need to configure your PCs IP address.

For Windows XP/2000

1) Click **Start** > **Control Panel**.

2) Select and double click **Network Connections**.

3) Right click Local Area Connection and then select Properties.

WAN Connection Type: To make sure the connection type your ISP provides, please refer to the ISP for more information.

Dynamic IP (DHCP): Connections use dynamic IP address assignment, it means your ISP is running a DHCP server.

Static IP: Connections use static IP address assignment, it means your ISP provides a static or fixed IP Address, Subnet Mask, Gateway and DNS setting.

PPPoE: Connections requires username and password.

L2TP: Layer 2 Tunneling Protocol (L2TP) is a service applies to connections in Israel only.

PPTP: Point-to-Point Tunneling Protocol (PPTP) is a service applies to connections in Europe only.

Select the connection type according to the information provided by your Internet Service Provider (ISP), and fill in the information accordingly.

MTU Size (in bytes): The default MTU (Maximum Transmission Unit) value is 1500 Bytes. Sometimes you need to modify the MTU required by your ISP.

Please check **Manually configure the DNS server** if your ISP gives you one or two DNS IP addresses. Otherwise, leave it unchecked, the DNS servers will be assigned from ISP dynamically. **Primary DNS Server:** Enter the DNS IP address in dotted-decimal notation provided by your ISP. **Secondary DNS Server:** Enter another DNS IP address in dotted-decimal notation provided by your ISP.

Note: If you get Address not found error when you access a website, it is likely that your DNS servers are set up improperly. You should contact your ISP for correct DNS server addresses.

► IP Bandwidth Control			
► System Tools	Save		

This section is to configure the advanced wireless setting of the Router, if you are not familiar with the setting items in this page, it's strongly recommended to keep the provided default values, otherwise it may result in lower wireless network performance.

Beacon Interval: The interval for sending packets of the Beacon frame. Its value range is 20-1000 in unit of ms. The default is 100.

DTIM Interval: It indicates the interval of the delivery traffic indication message (DTIM). The value range is between 1 and 255 milliseconds. The default value is 1.

Fragment Threshold: Set the fragmentation threshold. Packets larger than the size set in this field will be fragmented. Too many data packets will lower the Wireless Network performance. The Fragment Threshold value should not be set too low. The default value is 2346.

RTS Threshold: Set the RTS (Request to send threshold.) threshold. When the packet size is larger than the preset RTS size, the wireless router will send a RTS to the destination station to start a negotiation. The default value is 2347.

Enable WMM: If you select it, the router will process the packets with the priority first. You are recommended to select this option.

APSD Capable: It is used for auto power-saved service. It is **Disabled** by default.

Wireless Clients List

	<	2		

The WPS function can help you add a new device to the network quickly. If the client device supports Wi-Fi Protected Setup and is equipped with a WPS button, you can add it to the network by pressing the WPS button on the device and then press the button on the router within two minutes. The status LED on the router will light green for five minutes if the device has been successfully added to the network; If your client asks for the Router's PIN number, enter the router's PIN number into your client device; If your client device has a WIFI Protected Setup PIN number, enter that number in the PIN box.

WPS (Wi-Fi Protected Setting): Easy and quick to establish the connection between wireless

network client and the router through encrypted contents. The users only enter the PIN code to configure without selecting encryption method and entering secret keys by manual.

WPS Mode: Supports two ways to configure WPS settings: PBC (Push-Button Configuration) and PIN code.

PBC: Select the **PBC** button or press the WPS button on the panel of the Router. (Press WPS button and WPS LED will blink, which means the WPS function is enabled. During the blinking time, press the WPS button on another network device, WPS LED light will become solid when the connection succeeds.)

PIN: If this option is enabled, you need to enter a wireless clients PIN code in the blank and keep the same code in the client.

WDS Settings

Bridge Mode: You can wirelessly connect two or more wired networks via this mode. In this mode, you need to add the wireless MAC address of the connecting device into the Routers AP

MAC address table or select one from the scanning table. At the same time, the connecting device should be in Lazy, Repeater or Bridge mode.

Repeater Mode: You can select the mode to extend the distance between the two WLAN devices. Functioning as a WDS repeater, the connects to both a client card as an AP and to another AP. In typical repeater applications, APs connecting to other APs equipped with WDS functionality must also support WDS. In this mode, you need to add the MAC address of the connecting device into the Routers AP MAC address table and the connecting client should be in Lazy, Repeater or client mode.

Encryption Type: You can select WEP 64bits mode, WEP 128bits mode TKIP mode, AES mode for security here.

Encryption key: Enter the key, the key format is decided by the encryption method you selected.

Wireless Access Node MAC Address: Input the MAC address of the other wireless router.

Note: Two wireless routers must use the same channel, encryption type and encryption key.

DHCP Server

There are three submenus under the DHCP menu: DHCP, DHCP Clients List and Address Reservation. Click any of them, and you will be able to configure the corresponding function.

DHCP

▶ Running Status	DHCP	
 Setup Wizard 	DHCP Server	● Enabled ○ Disabled
 Network Settings 	Start IP Address	192 . 168 . 0 . 100
Wireless Settings	End IP Address	192 . 168 . 0 . 200
▼ DHCP Server	Lease Time	86400 sec (The default value is 864 00)
	Default Gateway	192 , 168 , 0 , 1
DHCR Clients List	Primary DNS Server	192 . 168 . 0 . 1 (Optional)
Address Reservation	Secondary DNS Server	,,,, (Optional)
► NAT		
 Security Options 	Save Cancel	

If you enable DHCP server of the router, the DHCP server automatically configures the TCP/IP protocol for each computer in the LAN.

DHCP Server: If you disable the server, please make sure you have another DHCP server in your network.

Start IP Address: The first address in the IP Address pool.

End IP Address: The last address in the IP Address pool.

Lease Time: It is the time interval that server will change to use another DHCP address.

Default Gateway: (Optional) Suggest to input the IP Address of the LAN port of the Router. **Primary DNS Server:** (Optional) Input the DNS IP address provided by your ISP. Or consult your ISP.

Secondary DNS Server: (Optional) You can input the IP Address of another DNS server if your ISP provides two DNS servers.

Note: To use the DHCP server function of the router, please configure all computers in the LAN as Obtain an IP Address automatically mode. This function will take effect after the router rebooted.

DHCP Clients list

Pupping Status	DHCP Clients List

	Save	Cancel								

Application Name: Describe the name of the application that being set.

Please select one of the applications: There are few common applications available such as Dailpad, MSN gaming, PC Phone etc. the blank will be automatically filled once been chosen.

Customize Application Name: If the application you want to add is not included, enter the blank manually.

Start/End Trigger Port: The port for outgoing traffic. An outgoing connection using this port will trigger this rule.

Protocol: The protocol used for Trigger Ports: **TCP**, **UDP** or **TCP/UDP**. If you are not clear about which protocol was being used, **TCP/UDP** is recommended.

Open Port: The port or port range used by the remote system when it responds to the outgoing request. A response using one of these ports will be forwarded to the PC that triggered this rule.

Open Port Protocol: The protocol used for Incoming Ports Range, it can be TCP, UDP or

TCP/UDP. If you are not clear about which protocol was being used, TCP/UDP is recommended.

Note:

- Before using Port Triggering, you should assign a static IP address to the designated server, and then enter this static IP address into router as the **Server IP Address**.
- Please ensure the SPI Firewall was closed before setting the port triggering. You could check the SPI Firewall settings at Security Options>Security Settings.

DMZ Host

▶ Running Status	DMZ Host								
 Setup Wizard 	DMZ	DMZ							
 Network Settings 	DMZ Status	Enable DMZ							
 Wireless Settings 	IP Address of the DMZ Host								
► DHCP Server									
▼ NAT	Save Cancel								

DMZ Status: Choose Enable DMZ.

IP Address of the DMZ Host: Enter the IP address of the computer in the LAN that you want to set to a DMZ host in the DMZ Host IP Address field.

Note:

- Before using DMZ Host, you should assign a static IP address to the designated server, and then enter this static IP address into router as the **Server IP Address**.
- DMZ priority is higher than the Port Forwarding, if the DMZ open, all the port forwarding rules are not effective.

UPnP

▶ Punning Status	UPnP

▼ NAT	Group List									
Port Forwarding	ID	Group Mac	Group IP	Host IP	Port	Status				
Port Triggering										

Multicast Forwarding enables the router to issue IGMP host message on behalf of hosts that the router discovered through standard IGMP interfaces.

Group Mac: The Mac Address of the Multicast Forwarding Group.

Group IP: The IP Address of the Multicast Forwarding Group.

Host IP: The IP Address of the Group members.

Port: The port number of the Multicast group.

Status: The status of the Multicast group.

Security Options

There are four submenus under the Security Options menu: Security Settings, Advanced Security Settings, Local Web Management and Remote Web Management. Click any of them, and you will be able to configure the corresponding function.

 Security Options
Security Settings
Advanced Security Settings
Local Web Management
Remote Web Management

Security Settings

	Security Settings				
 Running Status 					
▶ Setup Wizard	SPI				
 Network Settings 	SPI Firewall				
Hotwork Settings	VPN				
 Wireless Settings 	PPTP Pass-through	⊙ Enabled ◯ Disabled			
DHCP Server	12TP Pass-through				
► NAT	IPSec Pass-through	● Enabled ○ Disabled			
 Security Options 	ALG				
Security Settings	FTP ALG	● Enabled ○ Disabled			
Advanced Security Settings	TFTP ALG				
Local Web Management	SIP ALG	⊖Enabled ⊙Disabled			
Remote Web Management					
 Access Control 	Save Cancel				

SPI (Stateful Packet Inspection): When the SPI firewall is enabled, the system refuses all requests from the Internet. Only packets that belong to connections that respond requests from the LAN and for which status database is created can pass the firewall and access to the LAN. By default, the SPI is enabled. To expose all hosts in the LAN to the Internet, you can disable SPI.

VPN (Virtual Private Network): VPN provides a safe communication method among remote computers through WAN. If a host in the LAN wants to connect to the remote VPN network through the router by using the VPN protocol, such as PPTP, L2TP, or IPSec, you need to enable the corresponding VPN pass through.

ALG (Application Layer Gateway): ALG supports that some protocols at the application layer that adopt the control/data mode, such as FTP, TFTP, and H323, help to translate network addresses and ports at the NAT gateway. You are recommended to enable this option. The Common Service Port drop-down list contains some common service ports. You can select one and click Add to add the service port to the virtual server list.

Advanced Security Settings

	Advanced Security Settings			
 Kunning Status Setup Wizard 	Anti DoS Attack	⊙ Disabled		
 Network Settings 	Enable filtering ICMP-FLOOD attack			
 Wireless Settings 	ICMP-FLOOD Packet Threshold (5-3600)	packets/s		
► DHCP Server	Enable filtering UDP-FLOOD attack			
▶ NAT	UDP-FLOOD Packet Threshold (5-3600)	packets/s		
 Security Options 	Enable filtering TCP-SYN-FLOOD attack			
Security Settings	TCP-SYN-FLOOD Packet Threshold (5-3600)	packets/s		
Advanced Security Settings	Deny the PING packet from the WAN interface			
Local Web Management	Save			
Remote Web Management	Cure Curer			

Anti DoS Attack: Check to enable it for attack prevention.

IGMP-Flood Packet Threshold: If the number of ICMP data packets exceeds the threshold, the defense measures act immediately.

Enable filtering UDP-FLOOD attack: Select it if you want to protect against UDP-FLOOD attacks.

UDP-Flood Packet Threshold: If the number of UDP data packets exceeds the threshold, the defense measures act immediately.

Enable filtering TCP-SYN-FLOOD attack: Select it if you want to protect against TCP-SYN-FLOOD attacks.

TCP-SYN-Attack Packet Threshold: If the number of TCP-SYN data packets exceeds the threshold, the defense measures act immediately.

Block the PING packets from the WAN interface: If you select this option, the PC in the WAN cannot send the PING packets to the router.

Block the PING packets from the LAN: If you select this option, the PC in the LAN cannot send

the PING packets to the WAN.

Local Web Management

► Running Status	Local Web Management					
 Setup Wizard 	Allow all hosts in the LAN to access the Web management page Allow only MAC address in the list to access the Web management page					
 Network Settings 	MAC Address 1					
 Wireless Settings 	MAC Address 2					
DHCP Server	MAC Address 3					
▶ NAT	MAC Address 4					
 Security Options 						
Security Settings	Save Cancel					

By default, the router allows all computers in the LAN to log in to the router for Web management. If you select **Allow only MAC addresses in the list to access the Web management page**, and add MAC addresses to the list, only MAC addresses in the list can access the web management page of the router, while other computers in the LAN are blocked from accessing the router.

MAC Address 1/2/3/4: Enter the MAC addresses of LAN computers.

Remote Web Management

	Remote Web Management			
Running Status				
▶ Setup Wizard	Enable Remote Web Management			
	Web Management Port	80		
 Network Settings 				
Wireless Settings	Allowed Remote IP Address	255 . 255 . 255 . 255		
▶ DHCP Server	Sava Canaal			
▶ NAT	Calicel			

This section is to allow the network administrator to manage the Router remotely. If you want to access the Router from outside the local network, please select the **Enable Remote Web Management**.

Web Management Port: The management port open to outside access the default value is 80.

IP Address of Remote Web Management: Specify the range of the WAN IP address for remote management.

Access Control

There are two submenus under the Access Control menu: MAC/IP/Port Filter and Web URL Filter. Click any of them, and you will be able to configure the corresponding function.

Ping Packet Size: The size of transmitted data packet when Ping operation is carried out.

Ping Timeout: The timeout time of the ping operation.

Tracert Hops: The hops of tracert.

Click Start Diagnosis button, the selected ping or tracert testing will be started.

Below is a Ping diagnosis example that router has been connected to IP 172.16.160.31:

Diagnosis Result		
PING 172.16.160.31 (172.16.160.31): 64 data bytes 72 bytes from 172.16.160.31: seq=0 ttl=127 time=2.260 ms 72 bytes from 172.16.160.31: seq=1 ttl=127 time=1.900 ms 72 bytes from 172.16.160.31: seq=2 ttl=127 time=2.760 ms 72 bytes from 172.16.160.31: seq=3 ttl=127 time=3.620 ms		
172.16.160.31 ping statistics 4 packets transmitted, 4 packets received, 0% packet loss round-trip min/avg/max = 1.900/2.635/3.620 ms		

Below is a Ping diagnosis example that router has failed to connect to IP 100.1.1.1:

Diagnosis Result
PING 100.1.1.1 (100.1.1.1): 64 data bytes
---- 100.1.1.1 ping statistics ---4 packets transmitted, 0 packets received, 100% packet loss

Wake On LAN

 Security Options 			
 Access Control 	Save		

In the Export Settings column, click **Backup** button to save all configuration settings to your local computer as a file.

To restore the Router's configuration, follow these instructions:

- 1) Click Browse button to find the configuration file which you want to restore.
- 2) Click Save button to update the configuration with the file whose path is the one you have input or selected in the blank.

Note: Keep the power on during the process, in case of any damage.

Wireless			
Standards	IEEE 802.11n, IEEE 802.11g, IEEE 802.11b, CSMA/CA with ACK		
Data Rate	11n: 150Mbps 11g: 54Mbps 11b: 11Mbps		
Frequency Range	2.4-2.4835GHz		
Wireless Transmit Power	< 20dBm		
Modulation Type	OFDM/CCK/16-QAM/64-QAM		
	150M: -68dBm@10% PER		
	108M: -68dBm@10% PER		
Receive Sensitivity	54M: -68dBm@10% PER		
	11M: -85dBm@8% PER		
	6M: -88dBm@10% PER		
Wireless Security	64/128-bit WEP, WPA/WPA2-Enterprise, WPA /WPA2-Personal (TKIP/AES)		
System Requirements	Microsoft [®] Windows [®] 98SE, NT, 2000, XP, Vista and Windows 7		
Hardware			
	4 x 10/100Mbps LAN Port		
Interfaces	1 x 10/100Mbps WAN Port		
	1 x Power Connector		
Buttons	Power Button WPS Button Reset Button		
Power Supply	12VDC, 0.5A		
Dimensions (W x D x H)	150mm x 144mm x 28mm		
Others			
Operating Temperature	0°C~40°C (32°F~104°F)		
Storage Temperature	-40°C~70°C (-40°F~158°F)		
Relative Humidity	10%~90%, non-condensing		
Storage Humidity	5%~95%, non-condensing		
Certifications	FCC,CE, RoHS		
	1 x Wireless N Router		
	1 x Power Adapter		
Package Contents	1 x Resource CD		
	1 x Quick Installation Guide		
	1 x Ethernet Cable		

41

Appendix A: Troubleshooting

1. PHICOMM Setup cannot find my Router.

If PHICOMM Setup is not able to communicate with your Router during installation, please check the following items:

- 1) Ensure that the router and modem are both on.
- 2) Make sure the computer goes into the LAN port of the router.
- 3) Make sure the DSL modem goes into the WAN port of the router.
- 4) There may be firewall software on your computer preventing an outgoing connection. You may choose to temporarily disable this software before attempting setup.
- 5) Unplug the Routers power supply for 10 seconds, then plug it back in.

2. The DSL telephone line does not fit into the Router's Internet port.

The Router does not replace your modem. You still need your DSL modem to work with the Router. Connect the telephone line to the DSL modem, and then insert the setup CD into your computer. Follow the QIG to install your router.

3. I cannot login the router's web management page.

- 1) Make sure the computer goes into the LAN port of the router.
- 2) Check the computer's IP address, make sure the IP address is obtained automatically, for details please refer to the section of Configure the Computers IP Address in this manual.
- 3) Make sure you put 192.168.0.1 into the address bar, not the search bar.
- Check your web browser, make sure the Proxy server is unchecked. Take Internet Explorer as an example, go to Tools>Internet Options>Connections>LAN Settings, uncheck Use a proxy server for your LAN
- 5) If it tells you the username or password is error, and you cannot remember the new one, please reset router by pressing reset button for at least 6 seconds, and then try to login with default username and password (admin/admin).

4. The computer cannot connect to the Internet.

- 1) Make sure the DSL/cable modem goes into the WAN port of the router.
- 2) Make sure the computer goes into the LAN port of the router.
- 3) Ensure that the router and modem are both on.
- 4) Unplug the router, connect your computer to the modem directly, check the internet is working or not through your modem.

5. The computer cannot connect to the internet wirelessly.

Please make sure you can access the Internet when plug in the Ethernet cable from the router to the computer, otherwise, please refer to Question 4. Then check the wireless connection status on your computer:

- Search available networks and connect to your wireless network. If your wireless network name (SSID) is not listed in, please connect to router's LAN port by an Ethernet cable, login router's web management page 192.168.0.1 to make sure the Broadcast SSID is enabled. Please refer to Page 20 in this manual.
- 2) If you cannot connect to your wireless network, please make sure the password is correct. You can connect to router's LAN port by an Ethernet cable, login router's web management page 192.168.0.1 to double check your password. Please refer to Page 21 in this manual.
- 3) If there is no wireless network found in range on your computer, please make sure the wireless switch is turned on, and the wireless network adapter is working properly.
- 6. I've installed this new Router and some of my network clients (computers, game consoles etc.) are unable to connect.

Your new Router came pre-configured with a network name and no password. All clients must use this network name to connect wirelessly to your Router. You will need to find the network settings on your client, and select the network name from the list of available networks to join the wireless network. Details please refer to your client (computer, game consoles etc.).

Appendix B: Certification

FCC Statement

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/ TV technician for help.

FCC Caution

- Changes or modifications to this unit not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment.
- This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.
- For product available in the USA market, only channel 1~11 can be operated. Selection of other channels is not possible.
- This equipment complies with FCC RF radiation exposure limits set forth for an uncontrolled environment.
- This device and its antenna(s) must not be co-located or operation in conjunction with any other antenna or transmitter.

• This equipment should be installed and operated with a minimum distance of 20 centimeters between the radiator and your body.

CE Mark Warning

€€

Marking with the above symbol indicates compliance with the Essential Requirements of the R&TTE Directive of the European Union (1999/5/EC).

This is a class B product. In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.

National Restrictions

This device is intended for home and office use in all EU countries (and other countries following the EU Directive 1999/5/EC) without any limitation except for the countries mentioned below:

Country	Restriction	Reason/remark
Bulgaria	None	General authorization required for outdoor use and public service
France	Outdoor use limited to 10 mW e.i.r.p. within the band 2454-2483.5 MHz	Military Radiolocation use. Refarming of the 2.4 GHz band has been ongoing in recent years to allow current relaxed regulation. Full implementation planned 2012
Italy	None	If used outside of own premises, general authorization is required
Luxembourg	None	General authorization required for network and service supply(not for spectrum)
Norway	Implemented	This subsection does not apply for the geographical area within a radius of 20 km from the centre of Ny-Ålesund
Russian Federation	None	Only for indoor applications

Note: Please don't use the product outdoors in France.

Appendix C: Glossary

802.11b: The 802.11b standard specifies a wireless networking at 11 Mbps using direct-sequence spread-spectrum (DSSS) technology and operating in the unlicensed radio spectrum at 2.4GHz, and WEP encryption for security. 802.11b networks are also referred to as Wi-Fi networks.

802.11g: Specification for wireless networking at 54 Mbps using direct-sequence spread-spectrum (DSSS) technology, using OFDM modulation and operating in the unlicensed radio spectrum at 2.4GHz, and backward compatibility with IEEE 802.11b devices, and WEP encryption for security.

DDNS (Dynamic Domain Name System): The capability of assigning a fixed host and domain name to a dynamic Internet IP Address.

DHCP (Dynamic Host Configuration Protocol): A protocol that automatically configure the TCP/IP parameters for the all the PC(s) that are connected to a DHCP server.

DMZ (Demilitarized Zone): A Demilitarized Zone allows one local host to be exposed to the Internet for a special-purpose service such as Internet gaming or videoconferencing.

DNS (Domain Name System): An Internet Service that translates the names of websites into IP addresses.

Domain Name: A descriptive name for an address or group of addresses on the Internet.

DSL (Digital Subscriber Line): A technology allowing data to be sent or received over existing traditional phone lines.

ISP (Internet Service Provider): A company that can provide access to the Internet.

MTU (Maximum Transmission Unit): The size in bytes of the largest packet that can be transmitted.

NAT (Network Address Translation): NAT technology translates IP addresses of a local area network to a different IP address for the Internet.

PPPoE (Point to Point Protocol over Ethernet): PPPoE is a protocol for connecting remote hosts to the Internet over an always-on connection by simulating a dial-up connection.

SSID (Service Set Identification): It is a thirty-two character (maximum) alphanumeric key identifying a wireless local area network. For the wireless devices in a network to communicate with each other, all devices must be configured with the same SSID. This is typically the configuration parameter for a wireless PC card. It corresponds to the ESSID in the wireless Access Point and to the wireless network name.

WEP (Wired Equivalent Privacy): A data privacy mechanism based on a 64-bit or 128-bit or 152-bit shared key algorithm, as described in the IEEE 802.11 standard.

Wi-Fi: A trade name for the 802.11b wireless networking standard, given by the Wireless Ethernet Compatibility Alliance (WECA, see http://www.wi-fi.net), an industry standards group promoting interoperability among 802.11b devices.

WLAN (Wireless Local Area Network): A group of computers and associated devices communicate with each other wirelessly, which network serving users are limited in a local area.
