

Test of G2 Microsystems Model G2M5477

To: FCC 47 CFR Part15.247 & IC RSS-210

Test Report Serial No.: GMIS15-A2 Rev A

Test of G2 Microsystems Model G2M5477  
to  
FCC 47 CFR Part15.247 & IC RSS-210

Test Report Serial No.: GMIS15-A2 Rev A

This report supersedes: None

**Applicant:** G2 Microsystems  
Level 15, 24 Campbell St  
Haymarket, New South Wales  
Australia

**Product Function:** 2.4 GHz Active RFID Tag

**Copy No:** pdf      **Issue Date:** 10th February 2009

**This Test Report is Issued Under the Authority of:**

## **ACCREDITATION, LISTINGS & RECOGNITION**

### **ACCREDITATION**

MiCOM Labs, Inc. an accredited laboratory complies with the international standard EN ISO/IEC 17025. The company is accredited by the American Association for Laboratory Accreditation (A2LA) [www.a2la.org](http://www.a2la.org) test laboratory number 2381.01. MiCOM Labs test schedule is available at the following URL; <http://www.a2la.org/scopepdf/2381-01.pdf>

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

## LISTINGS

MiCOM Labs test facilities are listed by the following organizations;

### North America

#### **United States of America**

Federal Communications Commission (FCC) Listing #: 102167

#### **Canada**

Industry Canada (IC) Listing #: 4143A

### Japan Registration

VCCI Membership Number: 2959

- Radiation 3 meter site; Registration No. R-2881
- Line Conducted, Registration Nos. C-3181 & T-1470
- Emissions; Registration Nos. C-3180 & T-1469

## RECOGNITION

### **APEC MRA (Asia-Pacific Economic Community Mutual Recognition Agreement)**

#### **Conformity Assessment Body (CAB) – MiCOM Labs**

Test data generated by MiCOM Labs is accepted in the following countries under the APEC MRA.

| Country   | Recognition Body                                                                                        | Phase | CAB Identification No. |
|-----------|---------------------------------------------------------------------------------------------------------|-------|------------------------|

MiCOM Labs, Inc. tested the equipment mentioned in accordance with the requirements set forth in the above standards. Test results indicate that the equipment tested is capable of demonstrating compliance with the requirements as documented within this report.

### Notes:

1. This document reports conditions under which testing was conducted and the results of testing performed.
2. Details of test methods used have been recorded and kept on file by the laboratory.
3. Test results apply only to the item(s) tested.

Approved & Released for MiCOM Labs, Inc. by:

CERTIFICATE #2381.01

### 2.2. Test and Uncertainty Procedures

Conducted and radiated emission measurements were conducted in accordance with American National Standards Institute ANSI C63.4, listed in the Normative References section of this report.

Measurement uncertainty figures are calculated in accordance with ETSI TR 100 028 Parts 1 and 2.

Measurement uncertainties stated are based on a standard uncertainty multiplied by a coverage factor  $k = 2$ , providing a level of confidence of approximately 95 % in accordance with UKAS document M 3003 listed in the Normative References section of this report.

### 3.2. Scope of Test Program

The scope of the test program was to test the G2 Microsystems, RFID and real time local positioning and tracking device for compliance against FCC 47 CFR Part 15.247 and IC RSS-210 for modular approval.

In order to drive the G2M5477 802.11b/g wireless chipset a motherboard was utilized which could place the module into test mode with a 100% duty cycle.

#### G2 Microsystems 2.4 GHz RFID

### G2 Microsystems 2.4 GHz Wireless Module

**Issue Date:** 10th February 2009  
**Page:** 13 of 134

### 3.3. Equipment Model(s) and Serial Number(s)

| Type (EUT/Support) | Equipment Description (Including Brand Name) | Mfr             | Model No.    | Serial No.  |
|--------------------|----------------------------------------------|-----------------|--------------|-------------|
| EUT                | 802.11bg RFID Wireless Module                | G2 Microsystems | G2M5477      | 0587-000305 |
| Support            | Evaluation Board                             | G2 Microsystems | Morton Rev 3 | --          |
| Support            | Laptop                                       | Dell            | --           | --          |

### 3.4. Antenna Details

| Antenna Type          | Gain (dBi) | Integral | Manufacture      | Model |
|-----------------------|------------|----------|------------------|-------|
| Dipole                | 2.0        | No       | Pulse            | W1010 |
| Printed monopole/Chip | 2.1        | Yes      | Antenova/GigaAnt | Rufa  |

### 3.5. Cabling and I/O Ports

Number and type of I/O ports

1. UFL connector for external dipole antenna

### 3.6. Test Configurations

Matrix of test configurations

| Power Regulation | Operational Mode | Data Rates (MBit/s) | Frequencies (MHz) |
|------------------|------------------|---------------------|-------------------|
| No Boost         | 802.11b          | 1                   | 2412, 2437, 2462  |
| Boost*           | 802.11g          | 6                   |                   |

\*Only Boost mode was utilized for radiated testing as it was determined from conducted testing this was worst case emissions.

The device was connected to an external power supply to complete the conducted test suite. A battery was utilized for all radiated testing. The voltage on the battery was continually monitored and replaced when necessary.

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

---

### **3.7. Equipment Modifications**

The following modifications were required to bring the equipment into compliance:

1. During radiated emission testing the module had a problem failing the second harmonic 802.11b, channel 1 (2412 MHz), integral antenna in maximum power mode.

#### **Solution**

The client found that the power to the integral antenna was 2.5 dB higher than designed. The power was reduced through firmware update and retested. The EUT passed with maximum power to the integral antenna.

2. The equipment under test (EUT) was not under the control of the laboratory during the test program. The client removed the EUT and all support equipment upon completion of testing on a daily basis.

### **3.8. Deviations from the Test Standard**

The following deviations from the test standard were required in order to complete the test program:

1. NONE

### **3.9. Subcontracted Testing or Third Party Data**

The following subcontracted testing was required in order to complete the test program:

1. NONE

## 5. TEST RESULTS

### 5.1. Device Characteristics

#### 5.1.1. 6 dB and 99 % Bandwidth

**FCC, Part 15 Subpart C §15.247(a)(2)**

**Industry Canada RSS-210 §A8.2**

**Industry Canada RSS-Gen §4.4**

#### **Test Procedure**

The bandwidth at 6 dB and 99 % is measured with a spectrum analyzer connected to the antenna terminal, while EUT is operating in transmission mode at the appropriate center frequency. The analyzer was set for a 6 dB resolution bandwidth filter during this measurement.

#### **Test Measurement Set up**

Measurement set up for 6 dB and 99 % bandwidth test

#### **Measurement Results for 6 dB and 99 % Operational Bandwidth(s)**

Ambient conditions.

Temperature: 17 to 23 °C

Relative humidity: 31 to 57 %

Pressure: 999 to 1012 mbar

#### Operational Modes

- 1).. Boost
- 2).. No Boost

### 5.1.2. Peak Output Power

**FCC, Part 15 Subpart C §15.247(b)(3), §15.31(e)**  
**Industry Canada RSS-210 §A8.4(4)**

#### **Test Procedure**

The transmitter terminal of EUT was connected to the input of the spectrum analyzer set to measure peak power. The resolution filter bandwidth was set to 6 dB, peak detector selected and the analyzer built-in power function was used to measure peak power over the 99 % bandwidth. Initial measurements were employed to define which data rate provided the highest output power. Measurements were made while EUT was operating in a continuous transmission mode i.e. 100 % duty cycle at the appropriate center frequency.

#### **Test Measurement Set up**

Measurement set up for Transmitter Peak Output Power

Ambient conditions.

Temperature: 17 to 23 °C      Relative humidity: 31 to 57 %      Pressure: 999 to 1012 mbar

#### Operational Modes

- 1).. Boost
- 2).. No Boost

EIRP Calculation based on 2 dBi dipole antenna

## Specification

### Limits

**§15.247 (b)** The maximum peak output power of the intentional radiator shall not exceed the following:

**§15.247 (b) (3)** For systems using digital modulation in the 902-928 MHz, 2400-2483.5 MHz and 5725-5850 MHz bands: 1.0 watt.

**§15.31 (e)** For intentional radiators, measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, shall be performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage. For battery operated equipment, the equipment tests shall be performed using a new battery.

### Laboratory Measurement Uncertainty for Power Measurements

|                         |          |
|-------------------------|----------|
| Measurement uncertainty | ±1.33 dB |
|-------------------------|----------|

### Traceability

### 5.1.3. Peak Power Spectral Density

**FCC, Part 15 Subpart C §15.247(e)**  
**Industry Canada RSS-210 §A8.2**

#### **Test Procedure**

The transmitter output was connected to a spectrum analyzer and the maximum level in a 3 kHz bandwidth was measured. A peak value was found over the full emission bandwidth and the frequency span reduced to obtain enhanced resolution. Sweep time => span / 3 kHz with video averaging turned off. The Peak Power Spectral Density is the highest level found across the emission in a 3 kHz resolution bandwidth. Spectrum analyzer settings:

#### **Test Measurement Set up**

Measurement set up for Peak Power Spectral Density

#### **Measurement Results for Peak Power Spectral Density**

Ambient conditions.

Temperature: 17 to 23 °C      Relative humidity: 31 to 57 %      Pressure: 999 to 1012 mbar

#### Operational Modes

#### 5.1.4. Maximum Permissible Exposure

**FCC, Part 15 Subpart C §15.247(i)**  
**Industry Canada RSS-Gen §5.5**

##### Calculations for Maximum Permissible Exposure Levels

Power Density =  $P_d$  (mW/cm<sup>2</sup>) =  $EIRP / (4\pi d^2)$

$EIRP = P * G$

$P$  = Peak output power (mW)

$G$  = Antenna numeric gain (numeric)

$d$  = Separation distance (cm)

Numeric Gain =  $10^{(G \text{ (dBi)}/10)}$

$P$  (worst case) = +23.76 dBm, 237.7 mW

Antenna Gain (Worst Case) = 2.0 dBi, 1.58 numeric

Because the EUT belongs to the General Population/Uncontrolled Exposure the limit of power density is 1.0 mW/cm<sup>2</sup>

The MPE calculations are calculated using the maximum allowable power levels calculated for each antenna in Section 5.1.2 "Peak Output Power" of the report.

| Antenna Gain (dBi) | Numeric Gain (numeric) | Max Allowable Peak Power (dBm) | Max Allowable Peak Power (mW) | Calculated Safe Distance at 1 mW/cm <sup>2</sup> (cm) | Minimum Separation Distance (cm) |
|--------------------|------------------------|--------------------------------|-------------------------------|-------------------------------------------------------|----------------------------------|
| 2.0                | 1.58                   | +23.76                         | 237.7                         | 5.5                                                   | 20*                              |

**\*Note:** for mobile or fixed location transmitters the minimum separation distance is 20cm, even if calculations indicate the MPE distance to be less.

##### Specification - Maximum Permissible Exposure Limits

**§15.247(i)** Systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency levels in excess of the Commission's guidelines.

Limit S = 1mW / cm<sup>2</sup> from 1.310 Table 1

Note: for mobile or fixed location transmitters the minimum separation distance is 20cm, even if calculations indicate the MPE distance to be less.

##### Laboratory Measurement Uncertainty for Power Measurements

|                         |          |
|-------------------------|----------|
| Measurement uncertainty | ±1.33 dB |
|-------------------------|----------|

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

#### **5.1.5. Conducted Spurious Emissions**

**FCC, Part 15 Subpart C §15.247(d); 15.205; 15.209**

**Industry Canada RSS-210 §A8.5, §2.2**

**Industry Canada RSS-Gen 4.7**

#### **Test Procedure**

Conducted emissions were measured at a limit of 20 dB below the highest in-band spectral density measured with a spectrum analyzer connected to the antenna terminal. Emissions at the band edge were measured and recorded. Measurements were made while EUT was operating in transmit mode of operation at the appropriate center frequency.

#### **Test Measurement Set up**

Band-edge measurement test configuration

#### **Measurement Results of Conducted Spurious Emissions**

Ambient conditions.

Temperature: 17 to 23 °C    Relative humidity: 31 to 57 %    Pressure: 999 to 1012 mbar

### Conducted Band-Edge Results

Measurements were performed with the transmitter tuned to the channel closest to the band-edge being measured. All emissions were maximized during measurement. Limits which were derived from the band-edge measurements provided below are drawn on each plot.

TABLE OF RESULTS – 802.11b Boost Mode

| Center Frequency (MHz) | Band edge Frequency (MHz) | Limit (20 dB below peak of fundamental) (dBm) | Amplitude @ Band edge (dBm) | Margin (dB) |
|------------------------|---------------------------|-----------------------------------------------|-----------------------------|-------------|

## Specification

### Limits Band-Edge

| Lower Limit<br>Band-edge | Upper Limit<br>Band-edge | Limit below highest level of<br>desired power |
|--------------------------|--------------------------|-----------------------------------------------|
| 2,400 MHz                | 2,483.5 MHz              | $\geq 20$ dB                                  |

**§15.247(d)** In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits.

### §15.247(d)

If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in Section §15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(a)).

## Laboratory Measurement Uncertainty for Conducted Spurious Emissions

|                         |               |
|-------------------------|---------------|
| Measurement uncertainty | $\pm 2.37$ dB |
|-------------------------|---------------|

## Traceability

### **5.1.6. Radiated Emissions**

#### **5.1.6.1. Transmitter Radiated Spurious Emissions (above 1 GHz)**

**FCC, Part 15 Subpart C §15.247(d) 15.205; 15.209**

**Industry Canada RSS-210 §A8.5, §2.2, §2.6**

**Industry Canada RSS-Gen §4.7**

#### **Test Procedure**

Radiated emissions above 1 GHz are measured in the anechoic chamber at a 3-meter distance on every azimuth in both horizontal and vertical polarities. The emissions are recorded and maximized as a function of azimuth by rotation through 360° with a spectrum analyzer in peak hold mode. Depending on the frequency band spanned a notch filter and waveguide filter was used to remove the fundamental frequency. The highest emissions relative to the limit are listed for each frequency spanned.

All measurements on any frequency or frequencies over 1 MHz are based on the use of measurement instrumentation employing an average detector function. All measurements above 1 GHz were performed using a minimum resolution bandwidth of 1 MHz.

The product was initially tested to find worst case orientation for the maximization of spurious emissions. Worst case orientation was used for all emission testing.

The voltage on the battery was continually monitored and replaced when necessary.

#### **Test Measurement Set up**

**Measurement set up for Radiated Emission Test**

---

### Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Loss, and subtracting Amplifier Gain from the measured reading. All factors are included in the reported data.

$$FS = R + AF + CORR - FO$$

where: FS = Field Strength

R = Measured Spectrum analyzer Input Amplitude

AF = Antenna Factor

CORR = Correction Factor = CL – AG + NFL

CL = Cable Loss

AG = Amplifier Gain

FO = Distance Falloff Factor

NFL = Notch Filter Loss or Waveguide Loss

For example:

Given receiver input reading of 51.5 dB $\mu$ V; Antenna Factor of 8.5 dB; Cable Loss of 1.3 dB; Falloff Factor of 0 dB, an Amplifier Gain of 26 dB and Notch Filter Loss of 1 dB. The Field Strength of the measured emission is:

$$FS = 51.5 + 8.5 + 1.3 - 26.0 + 1 = 36.3 \text{ dB}\mu\text{V/m}$$

Conversion between dB $\mu$ V/m (or dB $\mu$ V) and  $\mu$ V/m (or  $\mu$ V) are done as:

$$\text{Level (dB}\mu\text{V/m)} = 20 * \text{Log (level (\mu V/m))}$$

$$40 \text{ dB}\mu\text{V/m} = 100 \mu\text{V/m}$$

$$48 \text{ dB}\mu\text{V/m} = 250 \mu\text{V/m}$$

Boost operational mode was used to prove compliance for radiated emissions. Boost mode was used as this was the worst case operational mode i.e. widest bandwidth and highest conducted power levels.

Integral and external antennas were exercised in order to prove compliance.

## Specification Limits

**FCC §15.247(d) and RSS-210 §A8.5** In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits.

### **FCC §15.247(d)**

If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in Section §15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(a)).

**IC RSS-210 §A8.5** If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under section A8.4(4), the attenuation required shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in Tables 2 and 3 is not required. In addition, radiated emissions which fall in the restricted bands of Table 1 must also comply with the radiated emission limits specified in Tables 2 and 3.

### **IC RSS-Gen §4.7**

The search for unwanted emissions shall be from the lowest frequency internally generated or used in the device (local oscillator, intermediate of carrier frequency), or from 30 MHz , whichever is the lowest frequency, to the 5<sup>th</sup> harmonic of the highest frequency generated without exceeding 40 GHz.

**FCC §15.205 (a)** Except as shown in paragraph (d) of 15.205 (a), only spurious emissions are permitted in any of the frequency bands listed.

**FCC §15.205 (a)** Except as shown in paragraphs (d) and (e) of this section, the field strength of emissions appearing within these frequency bands shall not exceed the limits shown in Section §15.209. At frequencies equal to or less than 1000 MHz, compliance with the limits in Section 15.209 shall be demonstrated using measurement instrumentation employing a CISPR quasi-peak detector. Above 1000 MHz, compliance with the emission limits in Section 15.209 shall be demonstrated based on the average value of the measured emissions. The provisions in Section 15.35 apply to these measurements.

**FCC §15.209 (a)** Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table.

### 5.1.6.2. Receiver Radiated Spurious Emissions (above 1 GHz)

#### Industry Canada RSS-Gen §4.8, §6

##### Test Procedure

Radiated emissions above 1 GHz are measured in the anechoic chamber at a 3-meter distance on every azimuth in both horizontal and vertical polarities. The emissions are recorded and maximized as a function of azimuth by rotation through 360° with a spectrum analyzer in peak hold mode. Depending on the frequency band spanned a notch filter and waveguide filter was used to remove the fundamental frequency. The highest emissions relative to the limit are listed for each frequency spanned.

All measurements on any frequency or frequencies over 1 MHz are based on the use of measurement instrumentation employing an average detector function. All measurements above 1 GHz were performed using a minimum resolution bandwidth of 1 MHz.

##### Test Measurement Set up

Measurement set up for Radiated Emission Test

##### Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Loss, and subtracting Amplifier Gain from the measured reading. All factors are included in the reported data.

$$FS = R + AF + CORR - FO$$

where: FS = Field Strength

R = Measured Spectrum analyzer Input Amplitude

AF = Antenna Factor

CORR = Correction Factor = CL – AG + NFL

CL = Cable Loss

AG = Amplifier Gain

FO = Distance Falloff Factor

NFL = Notch Filter Loss or Waveguide Loss

**Title:** G2 Microsystems Model G2M5477  
**To:** FCC 47 CFR Part15.247 & IC RSS-210  
**Serial #:** GMIS15-A2 Rev A  
**Issue Date:** 10th February 2009  
**Page:** 119 of 134

---

For example:

Given receiver input reading of 51.5 dB $\mu$ V; Antenna Factor of 8.5 dB; Cable Loss of 1.3 dB; Falloff Factor of 0 dB, an Amplifier Gain of 26 dB and Notch Filter Loss of 1 dB. The Field Strength of the measured emission is:

$$FS = 51.5 + 8.5 + 1.3 - 26.0 + 1 = 36.3 \text{ dB}\mu\text{V/m}$$

Conversion between dB $\mu$ V/m (or dB $\mu$ V) and  $\mu$ V/m (or  $\mu$ V) are done as:

$$\text{Level (dB}\mu\text{V/m)} = 20 * \text{Log (level (\mu V/m))}$$

$$40 \text{ dB}\mu\text{V/m} = 100 \mu\text{V/m}$$

$$48 \text{ dB}\mu\text{V/m} = 250 \mu\text{V/m}$$

The voltage on the battery was continually monitored and replaced when necessary.

## Specification

### Receiver Radiated Spurious Emissions

#### Industry Canada RSS-Gen §4.8,

The search for spurious emissions shall be from the lowest frequency internally generated or used in the receiver (e.g. local oscillator, intermediate or carrier frequency), or 30 MHz, whichever is the higher, to at least 3 times the highest tunable or local oscillator frequency, whichever is the higher, without exceeding 40 GHz.

#### RSS-Gen §6

The following receiver spurious emission limits shall be complied with;

- a. If a radiated measurement is made, all spurious emissions shall comply with the limits of Table 1.

| Frequency<br>(MHz) | Field Strength<br>( $\mu\text{V/m}$ ) | Field Strength<br>(dB $\mu\text{V/m}$ ) | Measurement Distance<br>(meters) |
|--------------------|---------------------------------------|-----------------------------------------|----------------------------------|
| 30-88              | 100                                   | 40.0                                    | 3                                |

### 5.1.6.3. Radiated Spurious Emissions (30M-1 GHz)

**FCC, Part 15 Subpart C §15.205/ §15.209**  
**Industry Canada RSS-210 §2.2**

#### Test Procedure

Preliminary radiated emissions are measured in the anechoic chamber at a 3-meter distance on every azimuth in both horizontal and vertical polarity. The emissions are recorded with a spectrum analyzer in peak hold mode. Emissions closest to the limits are measured in the quasi-peak mode with a CISPR compliant receiver. Only the highest emissions relative to the limit are listed.

#### Test Measurement Set up

The product was initially tested to find worst case orientation for the maximization of spurious emissions. Worst case orientation was used for all emission testing.

The voltage on the battery was continually monitored and replaced when necessary.

**Page:** 123 of 134

---

### Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Loss, and subtracting Amplifier Gain from the measured reading. In this test facility, the Antenna Factor, Cable Loss, and Amplifier Gains are loaded into the Rohde & Schwarz Receiver and the corrected field strength can be read directly on the receiver.

where:

$$FS = R + AF + CORR$$

FS = Field Strength  
R = Measured Receiver Input Amplitude  
AF = Antenna Factor  
CORR = Correction Factor = CL – AG + NFL  
CL = Cable Loss  
AG = Amplifier Gain

For example:

Given a Receiver input reading of 51.5dB $\mu$ V; Antenna Factor of 8.5dB; Cable Loss of 1.3dB; Falloff Factor of 0dB, an Amplifier Gain of 26dB and Notch Filter Loss of 1dB. The Field Strength of the measured emission is:

$$FS = 51.5 + 8.5 + 1.3 - 26.0 + 1 = 36.3\text{dB}\mu\text{V/m}$$

Conversion between dB $\mu$ V/m (or dB $\mu$ V) and  $\mu$ V/m (or  $\mu$ V) are done as:

$$\text{Level (dB}\mu\text{V/m)} = 20 * \text{Log (level (}\mu\text{V/m))}$$

$$40 \text{ dB}\mu\text{V/m} = 100\mu\text{V/m}$$

$$48 \text{ dB}\mu\text{V/m} = 250\mu\text{V/m}$$

## Specification

### Limits

**§15.205 (a)** Except as shown in paragraph (d) of 15.205 (a), only spurious emissions are permitted in any of the frequency bands listed.

**§15.205 (a)** Except as shown in paragraphs (d) and (e) of this section, the field strength of emissions appearing within these frequency bands shall not exceed the limits shown in Section §15.209. At frequencies equal to or less than 1000 MHz, compliance with the limits in Section 15.209 shall be demonstrated using measurement instrumentation employing a CISPR quasi-peak detector. Above 1000 MHz, compliance with the emission limits in Section 15.209 shall be demonstrated based on the average value of the measured emissions. The provisions in Section 15.35 apply to these measurements.

**§15.209 (a)** Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table.

### §15.209 (a) and RSS-Gen §2.2 Limit Matrix

| Frequency(MHz) | Field Strength<br>( $\mu\text{V/m}$ ) | Field Strength<br>( $\text{dB}\mu\text{V/m}$ ) | Measurement Distance<br>(meters) |

#### **5.1.7. AC Wireline Conducted Emissions (150 kHz – 30 MHz)**

**FCC, Part 15 Subpart C §15.207**

**Industry Canada RSS-Gen §7.2.2**

##### **Test Procedure**

The EUT is configured in accordance with ANSI C63.4. The conducted emissions are measured in a shielded room with a spectrum analyzer in peak hold in the first instance. Emissions closest to the limit are measured in the quasi-peak mode (QP) with the tuned receiver using a bandwidth of 9 kHz. The emissions are maximized further by cable manipulation. The highest emissions relative to the limit are listed.

All six transmitters were operational and terminated in a 50Ω load.

##### **Test Measurement Set up**

Measurement set up for AC Wireline Conducted Emissions Test

#### **Measurement Results for AC Wireline Conducted Emissions (150 kHz – 30 MHz)**

No test required the device was battery operated

## Specification

### Limit

**§15.207 (a)** Except as shown in paragraphs (b) and (c) of this section, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed the limits in the following table, as measured using a 50  $\mu\Omega$  line impedance stabilization network (LISN), see §15.207 (a) matrix below. Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal.

### §15.207 (a) Limit Matrix

The lower limit applies at the boundary between frequency ranges

| Frequency of Emission (MHz) | Conducted Limit (dB $\mu$ V) |           |
|-----------------------------|------------------------------|-----------|
|                             | Quasi-peak                   | Average   |
| 0.15-0.5                    | 66 to 56*                    | 56 to 46* |
| 0.5-5                       | 56                           | 46        |
| 5-30                        | 60                           | 50        |

\* Decreases with the logarithm of the frequency

### Laboratory Measurement Uncertainty for Conducted Emissions

|                         |               |
|-------------------------|---------------|
| Measurement uncertainty | $\pm 2.64$ dB |
|-------------------------|---------------|

### Traceability

| Method                                                                                     | Test Equipment Used                |
