Electronic Warfare Associates, Inc.

TEST REPORT FOR

Access Point Model: SKEY-KC

Tested To The Following Standards:

FCC Part 15 Subpart C Sections 15.207, 15.249 and RSS 210 Issue 8

Report No.: 94579-11

Date of issue: August 19, 2013

This test report bears the accreditation symbol indicating that the testing performed herein meets the test and reporting requirements of ISO/IEC 17025 under the applicable scope of EMC testing for CKC Laboratories, Inc.

We strive to create long-term, trust based relationships by providing sound, adaptive, customer first testing services. We embrace each of our customers' unique EMC challenges, not as an interruption to set processes, but rather as the reason we are in business.

the Future Ľ esting 0 1 Ľ 0 m

ADMINISTRATIVE INFORMATION

Test Report Information

REPORT PREPARED FOR:

Electronic Warfare Associates, Inc. 13873 Park Center Rd. Herndon, VA 20171 **REPORT PREPARED BY:**

Dianne Dudley CKC Laboratories, Inc. 5046 Sierra Pines Drive Mariposa, CA 95338

Representative: Jason Pizzillo Customer Reference Number: P210000039

DATE OF EQUIPMENT RECEIPT: DATE(S) OF TESTING: Project Number: 94579

July 22, 2013 July 22 - August 9, 2013

Report Authorization

The test data contained in this report documents the observed testing parameters pertaining to and are relevant for only the sample equipment tested in the agreed upon operational mode(s) and configuration(s) as identified herein. Compliance assessment remains the client's responsibility. This report may not be used to claim product endorsement by A2LA or any government agencies. This test report has been authorized for release under quality control from CKC Laboratories, Inc.

Steve -7 Be

Steve Behm Director of Quality Assurance & Engineering Services CKC Laboratories, Inc.

Test Facility Information

Our laboratories are configured to effectively test a wide variety of product types. CKC utilizes first class test equipment, anechoic chambers, data acquisition and information services to create accurate, repeatable and affordable test results.

TEST LOCATION(S): CKC Laboratories, Inc. 1120 Fulton Place Fremont, CA 94539

Conditions During Testing

This list is a summary of the conditions noted for or modifications made to the equipment during testing.

Summary of Conditions

The customer changed the routing of the differential traces in the Ethernet section of the EUT during spurious emissions testing.

EQUIPMENT UNDER TEST (EUT)

EQUIPMENT UNDER TEST

Access Point

Manuf: Electronic Warfare Associates, Inc. Model: SKEY-KC Serial: ENG1 / ENG2

AC/DC Power Adapter

Manuf: TRIAD Model: WSU075-1000 Serial: E345519

PERIPHERAL DEVICES

The EUT was not tested with peripheral devices.

FCC PART 15 SUBPART C

This report contains EMC emissions test results under United States Federal Communications Commission (FCC) 47 CFR 15C requirements for Unlicensed Radio Frequency Devices, Subpart C - Intentional Radiators.

15.31(e) Voltage Variations

| | | | |

Test Conditions / Notes:

Fundamental of the EUT

Software Used: C and is permanently burned into memory as binary machine language (two different processors, PIC and CC1110)

Temperature: 23.3°C Humidity: 39 % Atmospheric Pressure: 101.1 kPa High Clock: 26MHz

transmit operating frequency= 923MHz RF Output= 0dBm Gain of the antenna= +1 dBi

The EUT is a fixed device. It is placed on the 80cm Styrofoam table and set continuously transmitting. A RJ 45 cable is looped back to active RJ 45 port.

Test Conditions / Notes:

Radiated Spurious Emission Frequency Range: 9kHz to 30MHz

Software Used: C and is permanently burned into memory as binary machine language (two different processors, PIC and CC1110)

Temperature: 21.1°C Humidity: 42 % Atmospheric Pressure: 101.0 kPa High Clock: 26MHz

transmit operating frequency= 923MHz RF Output= 0dBm Gain of the antenna= +1 dBi

9kHz -150 kHz; RBW=200 Hz, VBW=200 Hz; 150 kHz-30 MHz; RBW=9 kHz, VBW=9 kHz; 30 MHz-1000 MHz; RBW=120 kHz, VBW=120 kHz, 1000 MHz-10000MHz, RBW=1 MHz, VBW=1 MHz.

The EUT is a fixed device. It is placed on the 80cm Styrofoam table and at the center of a turning table. The EUT is set continuously transmit. A RJ 45 Cable is looped back to active RJ 45 port

Note: The customer changed the routing of the differential traces in the Ethernet section of the EUT.

SUPPLEMENTAL INFORMATION

Measurement Uncertainty

| Uncertainty Value | Parameter |
|-------------------|---------------------------|
| 4.73 dB | Radiated Emissions |
| 3.34 dB | Mains Conducted Emissions |
| 3.30 dB | Disturbance Power |

The reported measurement uncertainties are calculated based on the worst case of all laboratory environments from CKC Laboratories, Inc. test sites. Only those parameters which require estimation of measurement uncertainty are reported. The reported worst case measurement uncertainty is less than the maximum values derived in CISPR 16-4-2. Reported uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k=2. Compliance is deemed to occur provided measurements are below the specified limits.

Emissions Test Details

TESTING PARAMETERS

Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

CORRECTION FACTORS

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in dB μ V/m, the spectrum analyzer reading in dB μ V was corrected by using the following formula. This reading was then compared to the applicable specification limit.

| SAMPLE CALCULATIONS | | | | |
|---------------------|---------------------|----------|--|--|
| | Meter reading | (dBµV) | | |
| + | Antenna Factor | (dB) | | |
| + | Cable Loss | (dB) | | |
| - | Distance Correction | (dB) | | |
| - | Preamplifier Gain | (dB) | | |
| = | Corrected Reading | (dBµV/m) | | |

TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

| MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE | | | | |
|--|---------------------|------------------|-------------------|--|
| TEST | BEGINNING FREQUENCY | ENDING FREQUENCY | BANDWIDTH SETTING | |
| CONDUCTED EMISSIONS | 150 kHz | 30 MHz | 9 kHz | |
| RADIATED EMISSIONS | 9 kHz | 150 kHz | 200 Hz | |
| RADIATED EMISSIONS | 150 kHz | 30 MHz | 9 kHz | |
| RADIATED EMISSIONS | 30 MHz | 1000 MHz | 120 kHz | |
| RADIATED EMISSIONS | 1000 MHz | >1 GHz | 1 MHz | |

SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or carrot ("^") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

<u>Peak</u>

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

Quasi-Peak

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

Average

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point the measuring device is set into the linear mode and the scan time is reduced.
