##### 4.3.1. Environmental Conditions

Temperature : 23°C

Relative Humidity : 52%

ATM Pressure : 101kPa

The testing was performed by Jerry Wu on 2023-05-17

#### 4.4. Manufacturer

The following equipments are installed on Power Line Conducted Emission Measurement to meet the commission requirement and operating regulations in a manner, which tends to maximize its emission characteristics in a normal application.

##### 4.4.1. 48 Unmanaged Gigabit Port and 2 SFP Port Switch (EUT)

Model Number : GWN7706

Manufacturer : Grandstream Networks, Inc.

#### 4.5. Operating Condition of EUT

4.5.1. Setup the EUT and simulator as shown as Section 4.1.

4.5.2. Turn on the power of all equipments.

4.5.3. Let the EUT work in test mode and measure it.

#### 4.6. Test Procedure

The EUT is put on the plane 0.8m high above the ground by insulating support and is connected to the power mains through a line impedance stabilization network (L.I.S.N.). This provides a 50ohm coupling impedance for the EUT system. Please refer the block diagram of the test setup and photographs. Both sides of AC lines are checked to find out the maximum conducted emission. In order to find the maximum emission levels, the relative positions of equipment and all of the interface cables shall be changed according to ANSI C63.4-2014 on Conducted Emission Measurement.

The bandwidth of test receiver is set at 9kHz.

The frequency range from 150kHz to 30MHz is checked.

#### 4.7. Data Explain

Over limit = Level (dB $\mu$ V) - Limit (dB $\mu$ V)

#### 4.8. Power Line Conducted Emission Measurement Results

**PASS.**

The frequency range from 150kHz to 30MHz is checked.

All data was recorded in the Quasi-peak and average detection mode.

## 5.2. Radiated Emission Limit (Class A)

All emanations from a class A device or system, including any network of conductors and apparatus connected thereto, shall not exceed the level of field strengths specified below:

Below 1GHz:

Frequency MHz	Distance Meters	Field Strengths Limit
		dB( $\mu$ V/m)
30-88	3	49.54
88-216	3	53.98
216-960	3	56.9
960-1000	3	60.0

Remark:

(1) Emission level dB ( $\mu$ V) = 20 log Emission level  $\mu$ V/m.

(2) The smaller limit shall apply at the cross point between two frequency bands.

(3) Distance is the distance in meters between the measuring instrument antenna and the closest point of any part of the device or system.

## 5.3. Test mode description

Test mode 1: System operation with Full load (Power module: BOU-45S12-F)

Test mode 2: System operation with Full load (Power module: R0057B)

Test mode 3: System operation with Full load (Power module: UES40-120333SPA-OP1)

### 5.3.1. Environmental Conditions

Temperature : 23 °C

Relative Humidity : 56 %

ATM Pressure : 101kPa

The testing was performed by Jason Liu on 2023-05-17.

## 5.4. Manufacturer

The following equipments are installed on Radiated Emission Measurement to meet the commission requirement and operating regulations in a manner, which tends to maximize its emission characteristics in a normal application.

#### 5.4.1.48 Unmanaged Gigabit Port and 2 SFP Port Switch (EUT)

Model Number : GWN7706  
 Manufacturer : Grandstream Networks, Inc.

### 5.5. Operating Condition of EUT

5.5.1. Setup the EUT and simulator as shown as Section 5.1.

5.5.2. Turn on the power of all equipments.

5.5.3. Let the EUT work in test mode and measure it.

### 5.6. Test Procedure

The EUT and its simulators are placed on a turntable, which is 0.8 meter high above ground. The turntable can rotate 360 degrees to determine the position of the maximum emission level. EUT is set 3.0 meters away from the receiving antenna, which is mounted on an antenna tower. The antenna can be moved up and down between 1.0 meter and 4 meters to find out the maximum emission level. Broadband antenna (calibrated bilog antenna) is used as receiving antenna. Both horizontal and vertical polarizations of the antenna are set on measurement. In order to find the maximum emission levels, all of the interface cables must be manipulated according to ANSI C63.4-2014 on radiated emission measurement.

The bandwidth of the Receiver is set at 9kHz in 9kHz-30MHz, 120 kHz in 30-1000MHz, and 1MHz for above 1GHz.

The frequency range from 30MHz to 5GHz is investigated.

Highest frequency generated or used in the device or on which the device operates or tunes (MHz)	Upper frequency of measurement range (MHz)
Below 1.705 .....	30.
1.705–108 .....	1000.
108–500 .....	2000.
500–1000 .....	5000.
Above 1000 .....	5th harmonic of the highest frequency or 40 GHz, whichever is lower.

## 5.7.Data Sample

Over Limit (dB) = Level (dB $\mu$ v/m) - Limit (dB $\mu$ v/m)

QP = Quasi-peak Reading

The “Over Limit” column of the following data tables indicates the degree of compliance with the applicable limit. For example, an over Limit of -7dB means the emission is 7dB below the limit.

## 5.8.Radiated Emission Measurement Result

**PASS.**

The frequency range from 30MHz to 25GHz is investigated.

- 1) Level= Reading + Factor
- 2) Over Limit = Level-Limit
- 3) For below 1GHz testing, if the maximized peak measured value complies with the limit, then it is unnecessary to perform QP/Average measurement.
- 4) For above 1GHz testing, when the test result of peak was 20dB below to the limit of peak, which can be compliant to the average limit, may just peak value was recorded.
- 5) Other emission which was more than 20dB below limit was not recorded.
