Remark:

Company Name and Address shown on Report, the sample(s) and sample Information were provided by the applicant who should be responsible for the authenticity which CTI hasn't verified. Model No.:WM1110-A,WM1110-S

Only the model WM1110-S was tested, Their electrical circuit design, layout, components used and internal wiring are identical, the difference is whether it contains an authentication chip or not.

WM1110-S has two different models of encryption chips,WM1110-S will use either of these two encryption chips and the other parts will be exactly the same.

4 General Information

4.1 Client Information

| Applicant: | Seeed Technology Co., Ltd. |
|--------------------------|---|
| Address of Applicant: | 9F,G3 Building,TCL International E City, Zhongshanyuan Road, Nanshan District, Shenzhen, Guangdong Province, P.R.C |
| Manufacturer: | SeeedTechnology Co., Ltd. |
| Address of Manufacturer: | 9F,G3 Building,TCLInternational E City, Zhongshanyuan Road, Nanshan District, Shenzhen, Guangdong Province, P.R.C |
| Factory: | Shenzhen Xinxian Technology Co, Limited |
| Address of Factory: | F5, Building B17, Hengfeng Industrial City, No.739 Zhoushi Rd, Baoan District, Shenzhen,Guangdong, P.R.C.F5, Building B17, Hengfeng Industrial City, No.739 Zhoushi Rd,Baoan District, Shenzhen, Guangdong, P.R.C. |

4.2 General Description of EUT

5.4 Carrier Frequency Separation

| Test Requirement: | 47 CFR Part 15C Section 15.247 (a)(1) | | | | | |
|------------------------|---|--|--|--|--|--|
| Test Method: | ANSI C63.10:2013 | | | | | |
| Test Setup: | Control Control Control Power Supply Power Toble RF test System Instrument | | | | | |
| | Remark: Offset=Cable loss+ attenuation factor. | | | | | |
| Test Procedure: | The RF output of EUT was connected to the spectrum analyzer by RF cable and attenuator. The path loss was compensated to the results for each measurement. Set to the maximum power setting and enable the EUT transmit continuously. Enable the EUT hopping function. Use the following spectrum analyzer settings: Span = wide enough to capture the peaks of two adjacent channels; RBW is set to approximately 30% of the channel spacing, adjust as necessary to best identify the center of each individual channel; VBW≥RBW; Sweep = auto; Detector function = peak; Trace = max hold. Use the marker-delta function to determine the separation between the peaks of the adjacent channels. Record the value in report. | | | | | |
| Limit: | Frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater. | | | | | |
| Exploratory Test Mode: | Hopping transmitting with all kind of modulation and all kind of data type | | | | | |
| Test Results: | Refer to Appendix A | | | | | |

5.6 Time of Occupancy

| Test Requirement: | 47 CFR Part 15C Section 15.247 (a)(1) |
|-------------------|--|
| Test Method: | ANSI C63.10:2013 |
| Test Setup: | C arteur C arteur Power Power Toble Table RF test System Instrument |
| | Remark: Offset=Cable loss+ attenuation factor. |
| Test Procedure: | The RF output of EUT was connected to the spectrum analyzer by RF cable and attenuator. The path loss was compensated to the results for each measurement. Set to the maximum power setting and enable the EUT transmit continuously. Enable the EUT hopping function. Use the following spectrum analyzer settings: Span = zero span, centered on a hopping channel; RBW shall be ≤ channel spacing and where possible RBW should be set >> 1 / T, where T is the expected dwell time per channel; VBW≥RBW; Sweep = as necessary to capture the entire dwell time per hopping channel; Detector function = peak; Trace = max hold. Measure and record the results in the test report. |
| Limit: | The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed. |
| Test Mode: | Hopping transmitting with all kind of modulation and all kind of data type. |
| Test Results: | Refer to Appendix A |
| 67 | |

5.7 Band edge Measurements

5.8 Conducted Spurious Emissions

| | Test Requirement: | 47 CFR Part 15C Section 15.247 (d) |
|---|------------------------|--|
| | Test Method: | ANSI C63.10:2013 |
| Ĩ | Test Setup: | Control Computer Dorfty Power Supph Table RF test System Instrument |
| | | Remark: Offset=Cable loss+ attenuation factor. |
| | Test Procedure: | The RF output of EUT was connected to the spectrum analyzer by RF cable and attenuator. The path loss was compensated to the results for each measurement. Set to the maximum power setting and enable the EUT transmit continuously. Set RBW = 100 kHz, VBW = 300kHz, scan up through 10th harmonic. All harmonics / spurs must be at least 20 dB down from the highest emission level within the authorized band as measured with a 100kHz RBW. Measure and record the results in the test report. The RF fundamental frequency should be excluded against the limit line in the operating frequency band. |
| Ś | Limit: | In any 100 kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement. |
| | Exploratory Test Mode: | Non-hopping transmitting with all kind of modulation and all kind of data type |
| | Test Results: | Refer to Appendix A |

| Exploratory Test Mode | Repeat above procedures until all frequencies measured was complete. Non-hopping transmitting mode with all kind of modulation and all kind of |
|-----------------------|---|
| | f. If the emission level of the EUT in peak mode was 10dB lower than the limit specified, then testing could be stopped and the peak values of the EUT would be reported. Otherwise the emissions that did not have 10dB margin would be re-tested one by one using peak, quasi-peak or average method as specified and then reported in a data sheet. g. Test the EUT in the lowest channel (2402MHz),the middle channel (2441MHz),the Highest channel (2480MHz) h. The radiation measurements are performed in X, Y, Z axis positioning for Transmitting mode, and found the X axis positioning which it is the worst case. |
| | d. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters (for the test frequency of below 30MHz, the antenna was tuned to heights 1 meter) and the rotatable table was turned from 0 degrees to 360 degrees to find the maximum reading. e. The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode. |
| | distance, while keeping the measurement antenna aimed at the source of emissions at each frequency of significant emissions, with polarization oriented for maximum response. The measurement antenna may have to be higher or lower than the EUT, depending on the radiation pattern of the emission and staying aimed at the emission source for receiving the maximum signal. The final measurement antenna elevation shall be that which maximizes the emissions. The measurement antenna elevation for maximum emissions shall be restricted to a range of heights of from 1 m to 4 m above the ground or reference ground plane. b. The EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower. c. The antenna height is varied from one meter to four meters above the |
| Test Procedure: | a. 1) Below 1G: The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter semi-anechoic camber. The table was rotated 360 degrees to determine the position of the highest radiation. 2) Above 1G: The EUT was placed on the top of a rotating table 1.5 meters above the ground at a 3 meter semi-anechoic camber. The table was rotated 360 degrees to determine the position of the highest radiation. Note: For the radiated emission test above 1GHz: Place the measurement antenna away from each area of the EUT determined to be a source of emissions at the specified measurement |

Radiated Spurious Emission below 1GHz:

During the test, the Radiates Emission from 30MHz to 1GHz was performed in all modes, only the worst case lowest channel of LORA was recorded in the report.

Remark:

1) The field strength is calculated by adding the Antenna Factor, Cable Factor & Preamplifier. The basic equation with a sample calculation is as follows:

Final Test Level = Receiver Reading + Antenna Factor + Cable Factor – Preamplifier Factor

2) Scan from 9kHz to 25GHz, the disturbance above 10GHz and below 30MHz was very low. As shown in this section, for frequencies above 1GHz, the field strength limits are based on average limits. However, the peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any condition of modulation. So, only the peak measurements were shown in the report.
