2.0 TEST SUMMARY AND RESULTS

The EUT (Equipment Under Test) is an Air Flow Hood, HVIN: SAH22A, manufactured by Dwyer Instruments, Inc. The detailed test results are presented in a separate section. The following is a summary of the test results.

Spread Spectrum Transmitter Requirements

Environmental Phenomena	Frequency Range	FCC Section	RSS- Section	Test Result
RF AC Mains Conducted Emissions	0.15 - 30 MHz	15.207	GEN; 7.2.2	Pass
RF Radiated Emissions (Unintential Radiation Receive mode)	30-25,000 MHz	15.209	GEN; 7.2.5	Pass
6 dB Bandwidth Test	2400 to 2483 MHz	15.247 a	247; 5.2 (1)	Pass
20 dB Bandwidth Test	2400 to 2483 MHz	15.247 a	GEN	Pass
Peak Output Power	2400 to 2483 MHz	15.247 b	247; 5.4	Pass
Band-edge Compliance of RF Conducted Emissions	2400 to 2483 MHz	15.247 d	247; 5.5	Pass
Spurious Radiated Emissions	30 MHz to 25 GHz	15.247 d	247; 5.5	Pass
Power Spectral Density	2400 to 2483 MHz	15.247 e	247; 5.2 (2)	Pass

Note: The RSS-247 specification is not currently covered in Radiometrics' Scope of Accreditation. This is technically very similar to FCC, CFR 47 Part 15, which is on Radiometrics' scope.

2.1 RF Exposure Compliance Requirements

The EUT meets the FCC requirement for RF exposure and it is exempt from RSS-102 SAR and RF exposure evaluations because the power output is less than 200 mW. There are no power level adjustments available to the end user. The detailed calculations for RF Exposure are presented in a separate document. This is not used within 20 cm of personnel.

3.0 EQUIPMENT UNDER TEST (EUT) DETAILS

3.1 EUT Description

The EUT is an Air Flow Hood, HVIN: SAH22A, manufactured by Dwyer Instruments, Inc. The EUT was in good working condition during the tests, with no known defects.

3.1.1 FCC Section 15.203 & RSS-GEN Antenna Requirements

The antenna is a monopole. The antenna has an MMCX connector type that is not readily available to the general public. The connector is internal to the product. Therefore, it meets the 15.203 Requirements. The antenna gain is 5 dBi.

Since the separation distance between personnel and the antenna is greater than or equal to 20 cm and the average e.i.r.p. of the Product is 92 mW, it is exempt from routine SAR evaluations in accordance to Section 2.5.1 of RSS-102 issue 5, table 1. Table 1 has a limit of 309mW for devices operating at 2450 MHz with a separation distance greater than 50 mm.

3.2 Related Submittals

Dwyer Instruments, Inc is not submitting any other products simultaneously for equipment authorization related to the EUT.

4.0 TESTED SYSTEM DETAILS

4.1 Tested System Configuration

The system was configured for testing in a typical fashion. The EUT was placed on an 80-cm high, nonconductive test stand. The testing was performed in conditions as close as possible to installed conditions. Wiring was consistent with manufacturer's recommendations. The EUT was tested as a stand-alone device. Power was supplied at 120 VAC, 60 Hz single-phase to its external power supply.

The identification for all equipment, plus descriptions of all cables used in the tested system, are:

Tested System Configuration List

Item	Description	Type*	Manufacturer	Model Number	Serial Number
1	Air Flow Hood	E	Dwyer Instruments, Inc	SAH22A	0004
2	USB power Supply	P	Apple	A1385	D292034F1QYDHLHAE

* Type: E = EUT, P = Peripheral, S = Support Equipment; H = Host Computer

Power Spectral Density	1, 6, 11	802.11n	6.5	
Conducted Emissions, AC Mains	6	802.11b	1.0	Note 1

Note 1: During preliminary testing, 802.11b mode Channel 6 was found to be worst case for this test.

The transmit mode for all tests was continuous. The continuous mode produces a Duty cycle of at least 98%.

4.3 Special Accessories

No special accessories were used during the tests in order to achieve compliance.

4.4 Equipment Modifications

The following modifications were made prior to the start of compliance testing:

A ferrite P/N 0431167281 was added to the coaxial cable.
Conducted coating was applied to the housing around the main PCB.

5.0 TEST SPECIFICATIONS

Document	Date	Title
FCC CFR Title 47	2015	Code of Federal Regulations Title 47, Chapter 1, Federal Communications Commission, Part 15 - Radio Frequency Devices
IC RSS-247 Issue 1	2015	Digital Transmission Systems (DTSs), Frequency Hopping Systems (FHSs) and Licence-Exempt Local Area Network (LE-LAN) Devices
IC RSS-Gen Issue 4	2014	General Requirements and Information for the Certification of Radiocommunication Equipment (RSS-Gen)

6.0 TEST PROCEDURE DOCUMENTS

The tests were performed using the procedures from the following specifications:

Document	Date	Title
ANSI C63.4-2014	2014	Methods of Measurement of Radio Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz
ANSI C63.10-2013	2013	American National Standard for Testing Unlicensed Wireless Devices
558074 D01 DTS Meas Guidance	2016	Guidance for Performing Compliance Measurements On Digital Transmission Systems (DTS) Operating Under §15.247; v03r04

7.0 RADIOMETRICS' TEST FACILITIES

The results of these tests were obtained at Radiometrics Midwest Corp. in Romeoville, Illinois, USA. Radiometrics is accredited by A2LA (American Association for Laboratory Accreditation) to conform to ISO/IEC 17025: 2005 "General Requirements for the Competence of Calibration and Testing Laboratories". Radiometrics' Lab Code is 121191 and Certification Number is 1495.01. Radiometrics' scope of accreditation includes all of the test methods listed herein. A copy of the accreditation can be accessed on our web site (www.radiomet.com). Radiometrics accreditation status can be verified at A2LA's web site (www.a2la2.org).

The following is a list of shielded enclosures located in Romeoville, Illinois used during the tests:

Chamber E: Is a custom made anechoic chamber that measures 52' L X 30' W X 18' H. The walls and ceiling are fully lined with RF absorber. Pro-shield of Collinsville, Oklahoma manufactured the chamber. The floor has a 9' x 9' section of microwave absorber for testing above 1 GHz.

Test Station F: Is an area that measures 10' D X 12' W X 10' H. The floor and back wall are metal shielded. This area is used for conducted emissions measurements.

A separate ten-foot long, brass plated, steel ground rod attached via a 6 inch copper braid grounds each of the above chambers. Each enclosure is also equipped with low-pass power line filters.

The FCC has accepted these sites as test site number US1065. The FCC test site Registration Number is 732175. Details of the site characteristics are on file with Innovation, Science, and Economic Development Canada as site number IC 8727A-1.

A complete list of the test equipment is provided herein. The calibration due dates are indicated on the equipment list. The equipment is calibrated in accordance to ANSI/NCSL Z540-1 with traceability to the National Institute of Standards and Technology (NIST).

8.0 DEVIATIONS AND EXCLUSIONS FROM THE TEST SPECIFICATIONS

There were no deviations or exclusions from the test specifications.

9.0 CERTIFICATION

Radiometrics Midwest Corporation certifies that the data contained herein was taken under conditions that meet or exceed the requirements of the test specification and the data contained herein was taken with calibrated test equipment. The results relate only to the EUT listed herein.

11.0 TEST SECTIONS

11.1 AC Conducted Emissions

The tests and limits are in accordance with FCC section 15.207 and RSS Gen section 7.2.2.

A computer-controlled analyzer was used to perform the conducted emissions measurements. The frequency range was divided into 500 subranges equally spaced on a logarithmic scale. The computer recorded the peak of each subrange. This data was then plotted on a semi-log graph generated by the computer. Adjusting the positions of the cables and orientation of the test system then maximizes the highest emissions.

Mains Conducted emission measurements were performed using a 50 Ohm/50 uH Line Impedance Stabilization Network (LISN) as the pick-up device. Measurements were repeated on both leads within the power cord. If the EUT power cord exceeded 80 cm in length, the excess length of the power cord was made into a 30 to 40 cm bundle near the center of the cord. The LISN was placed on the floor at the base of the test platform and electrically bonded to the ground plane.

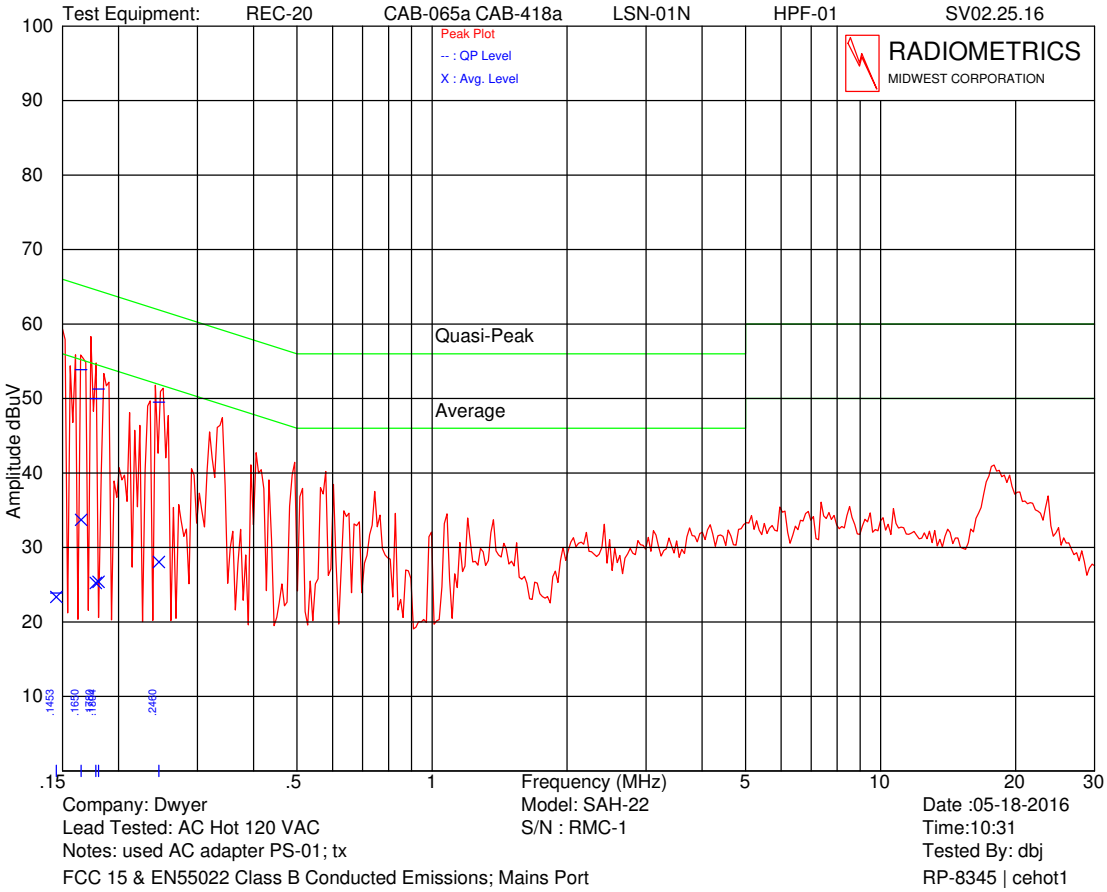
FCC Limits of Conducted Emissions at the AC Mains Ports

Frequency Range (MHz)	Class B Limits (dBuV)	
	Quasi-Peak	Average
0.150 - 0.50*	66 - 56	56 - 46
0.5 – 5.0	56	46
5.0 - 30	60	50
* The limit decreases linearly with the logarithm of the frequency in this range.		

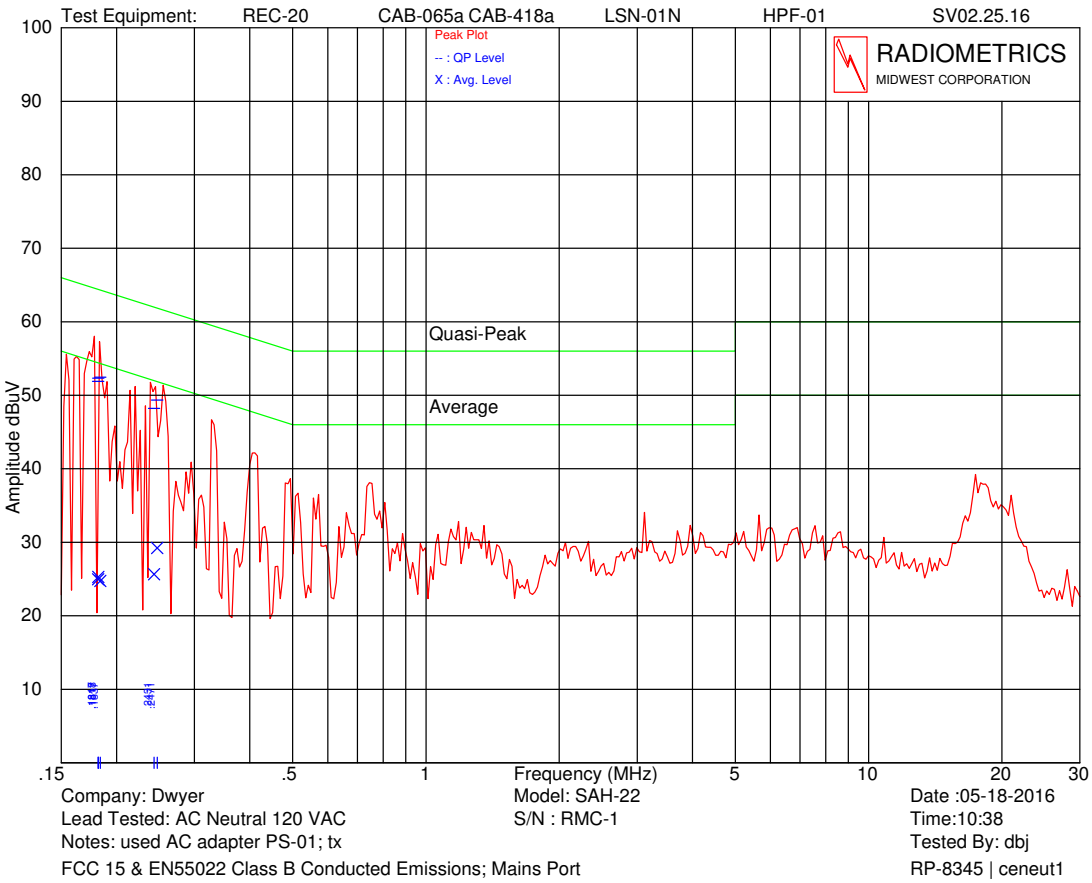
The initial step in collecting conducted data is a peak detector scan and the plotting of the measurement range. Significant peaks are then marked as shown on the following table, and these signals are then measured with the quasi-peak detector. The following represents the worst case emissions from the external USB charger (with the EUT connected) power cord, after testing all modes of operation.

Test Date: May 18, 2016
The Amplitude is the final corrected value with cable and LISN Loss.
QP readings are quasi-peak with a 9 kHz bandwidth and no video filter.

Judgment: Passed by at least 6 dB



Frequency (MHz)	QP Amp. (dBuV)	QP Limit (dBuV)	Average Amp. (dBuV)	Average Limit (dBuV)	Margin Under Limit (dB)
0.145	23.9	66.3	23.4	56.3	32.9
0.165	53.9	65.2	33.7	55.2	11.3
0.178	50.0	64.6	25.2	54.6	14.6
0.180	51.3	64.5	25.4	54.5	13.2
0.246	49.5	61.9	28.1	51.9	12.4



Frequency (MHz)	QP Amp. (dBuV)	QP Limit (dBuV)	Average Amp. (dBuV)	Average Limit (dBuV)	Margin Under Limit (dB)
0.182	52.3	64.4	25.3	54.4	12.1
0.182	51.9	64.4	25.0	54.4	12.5

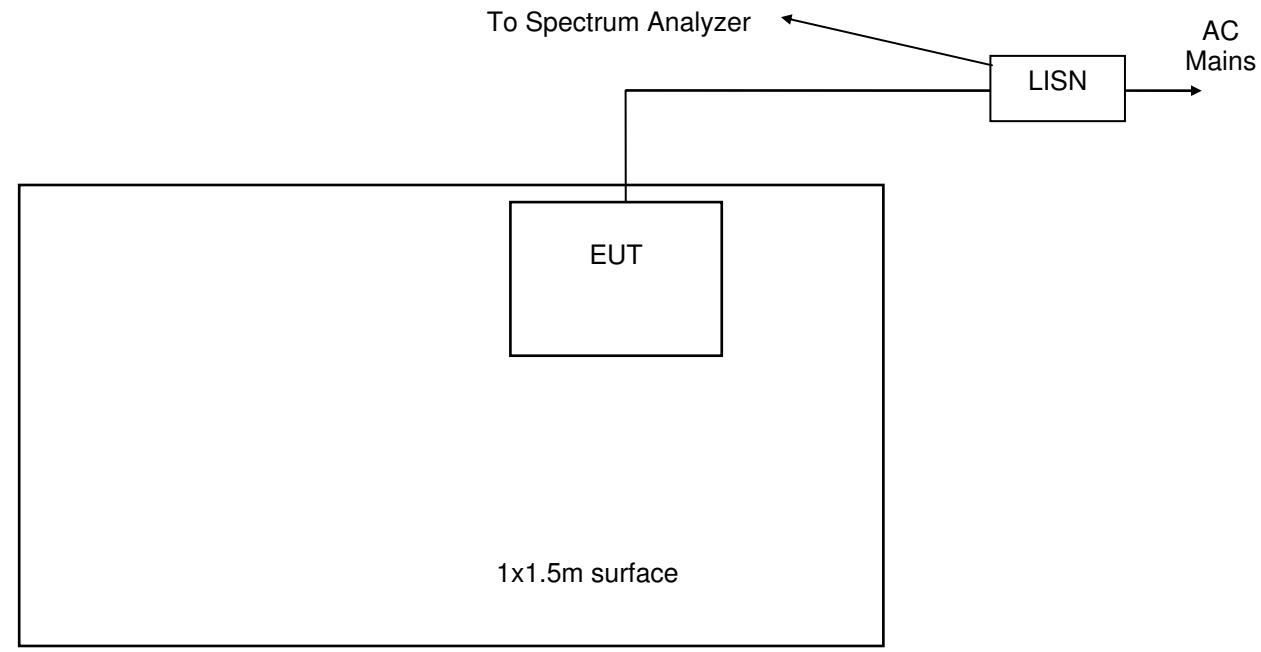
0.243	48.2	62.0	25.6	52.0	13.8
0.247	49.3	61.9	29.2	51.9	12.5

Figure 1. Conducted Emissions Test Setup



Notes:
- LISN's at least 80 cm from EUT chassis
- Vertical conductive plane 40 cm from rear of table top

11.2 Occupied Bandwidth

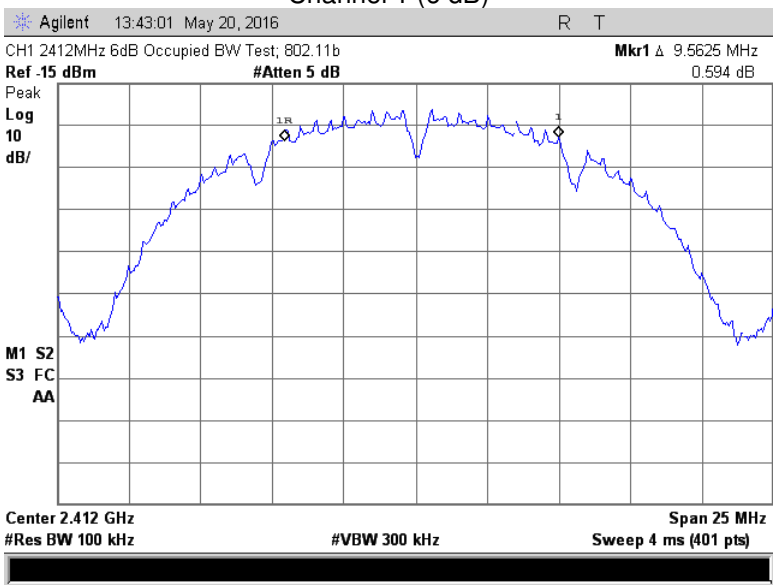
The test procedures were in accordance to FCC DTS Measurement Guideline 558074 D01, Section 8.1.

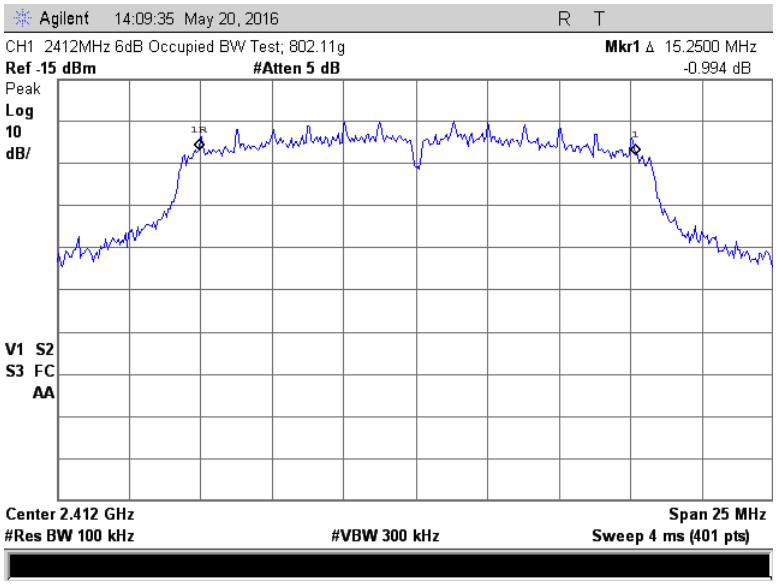
The spectrum analyzer was set to the MAX HOLD mode to record the worst case of the modulation. The EUT was transmitting at its maximum data rate. The trace was allowed to stabilize.
The marker-to-peak function was set to the peak of the emission. Then the marker-delta function was used to measure 6 or 20 dB down one side of the emission. The marker-delta function was reset and then moved to the other side of the emission, until it is (as close as possible to) even with the reference marker level. The marker-delta reading at this point is the bandwidth of the emission.

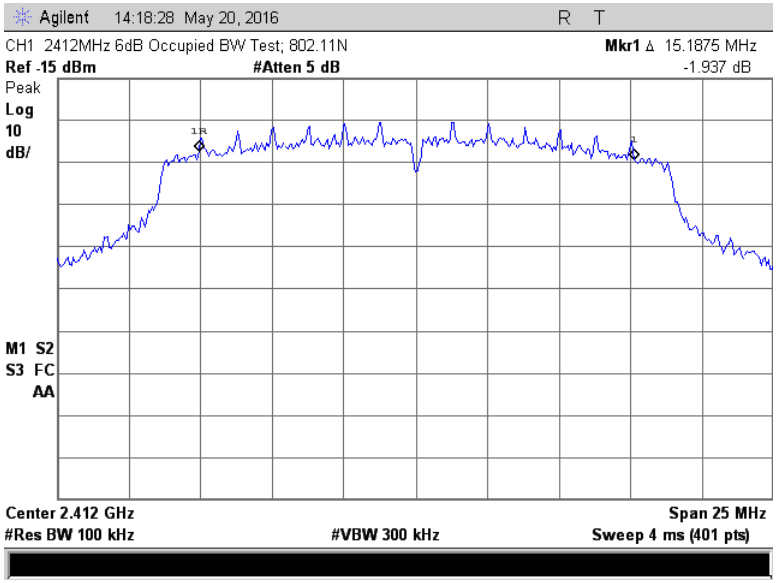
BW Type	Mode	EUT MHz	BW MHz	EUT MHz	BW MHz	EUT MHz	BW MHz
6 dB	b	2412	9.56	2437	9.94	2462	9.94
6 dB	g	2412	15.25	2437	15.25	2462	15.00
6 dB	N	2412	15.19	2437	15.13	2462	15.13
20 dB	b	2412	16.19	2437	16.25	2462	16.25
20 dB	g	2412	19.18	2437	20.19	2462	19.19
20 dB	N	2412	20.19	2437	20.50	2462	20.06

The 6 dB bandwidth is greater than 500 kHz
Judgement: Pass
Tested by: Richard Tichgelaar
Test Date: May 20 and May 23, 2016

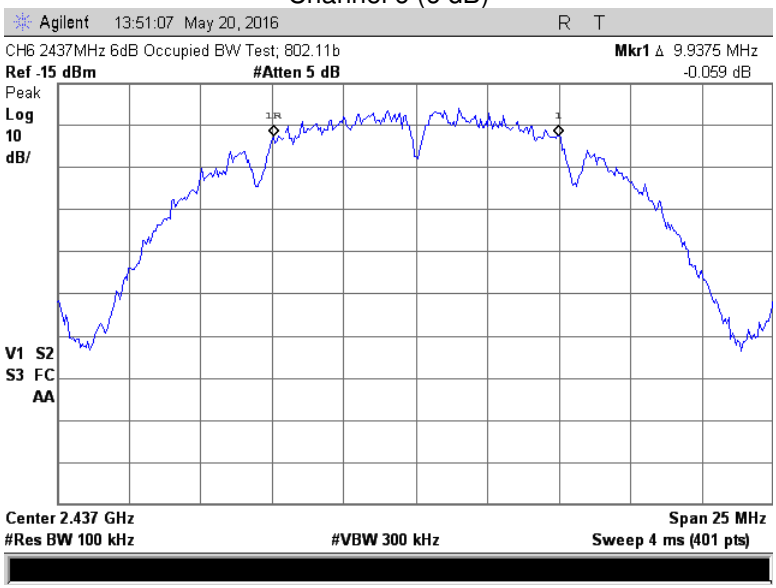
Channel 1 (6 dB)

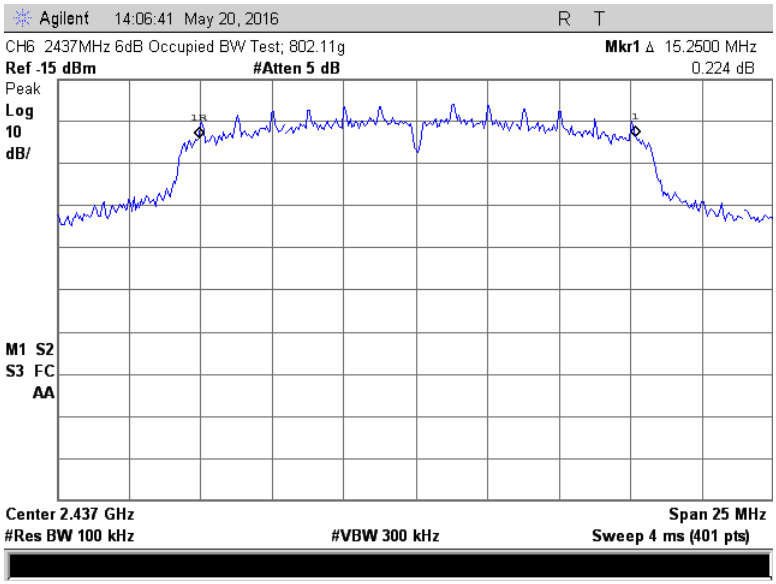


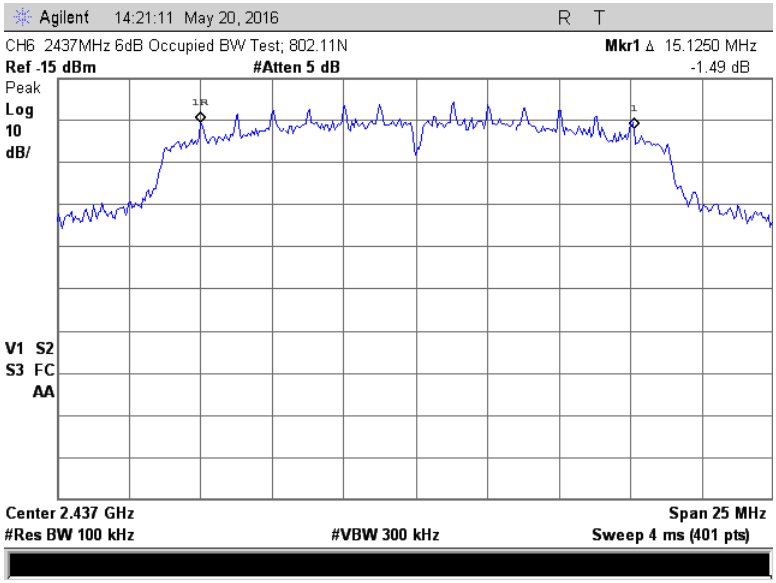




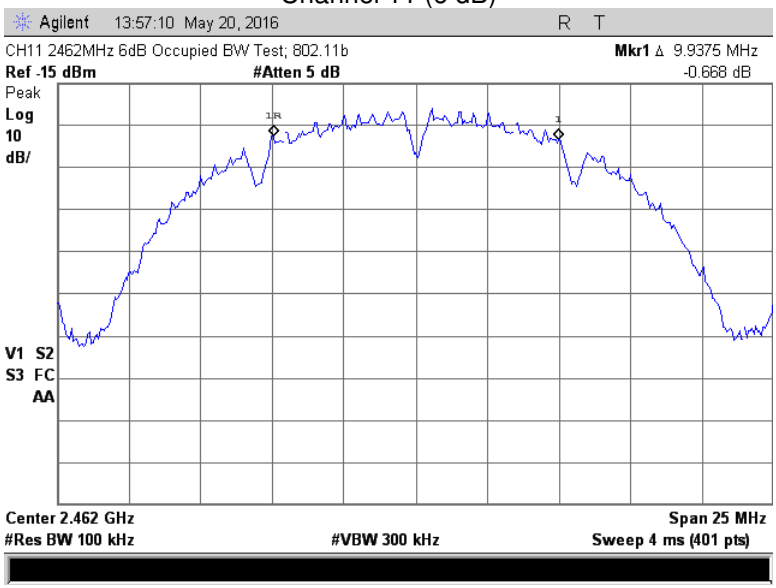
Channel 6 (6 dB)

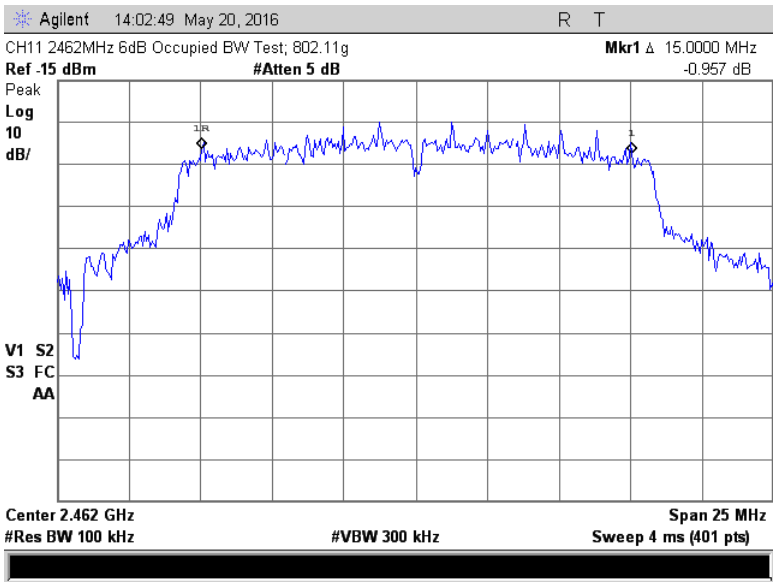


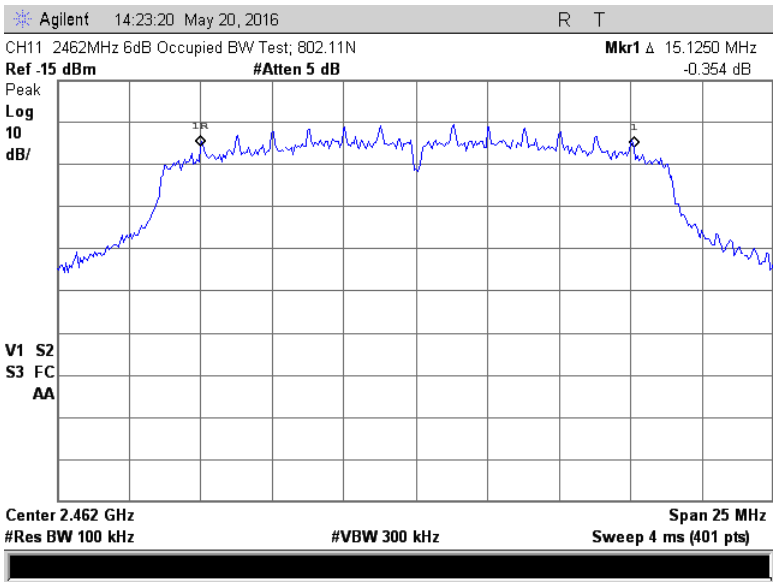




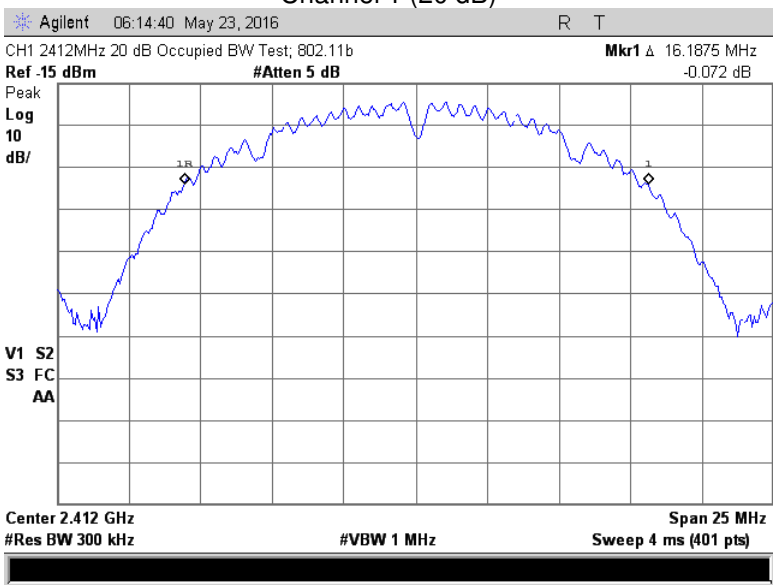
Channel 11 (6 dB)

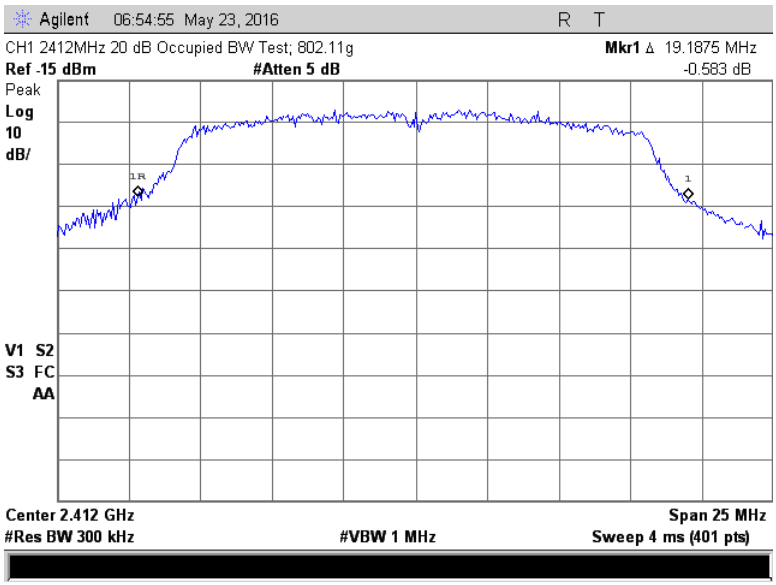


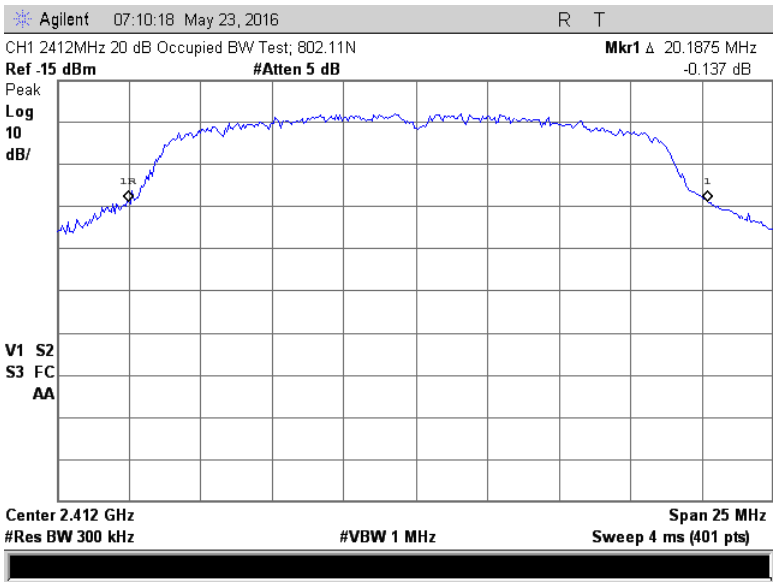




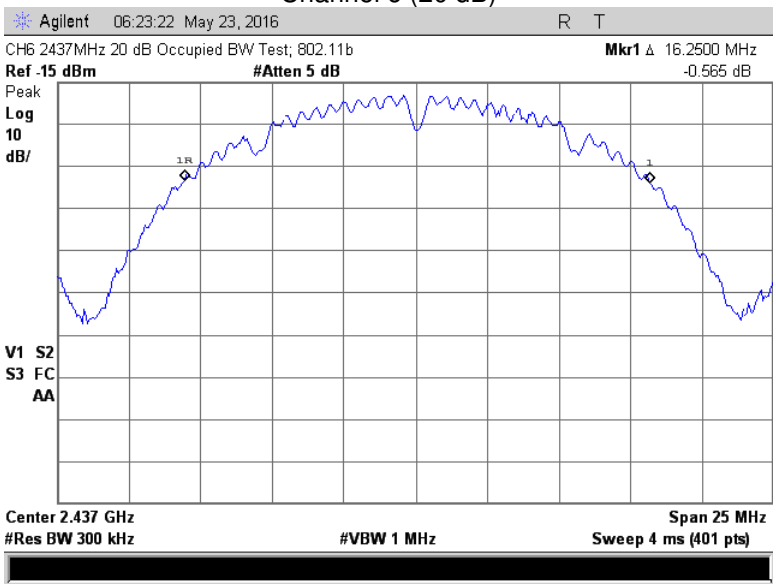
Channel 1 (20 dB)

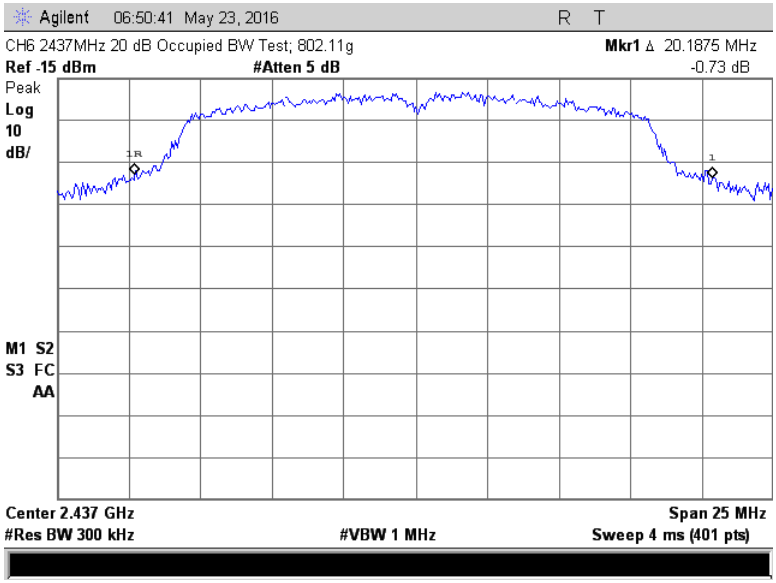


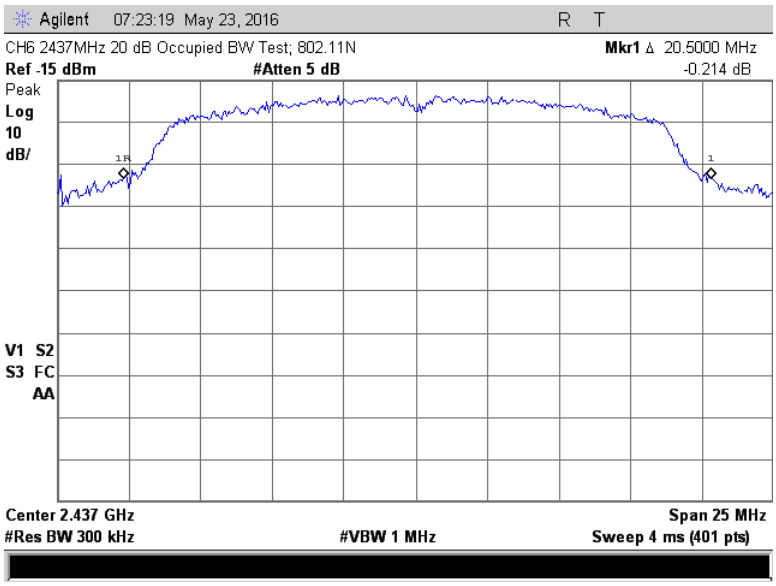




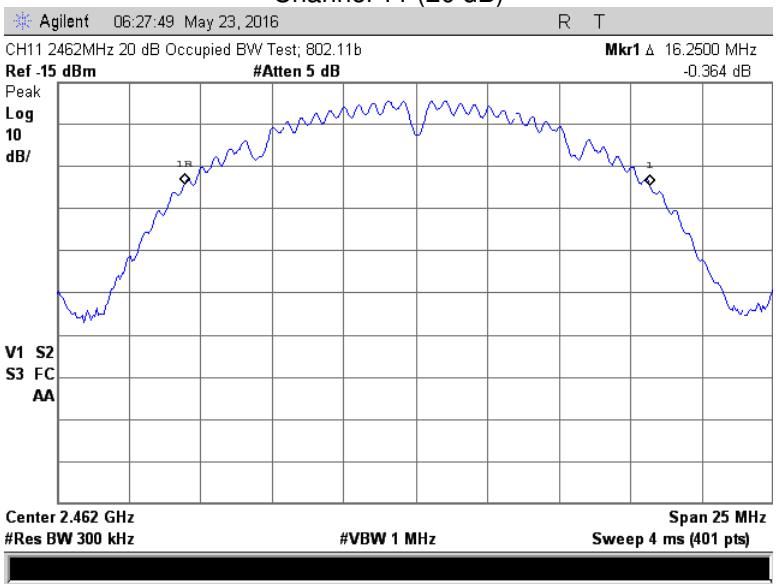
Channel 6 (20 dB)

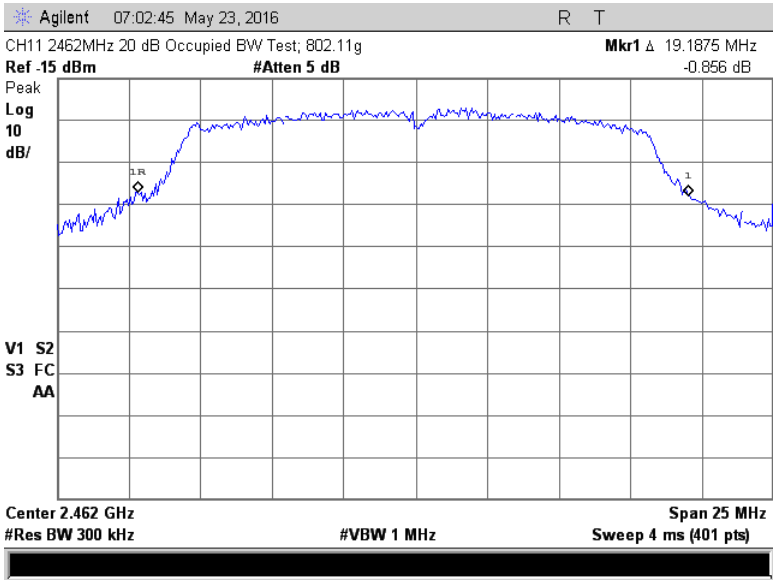


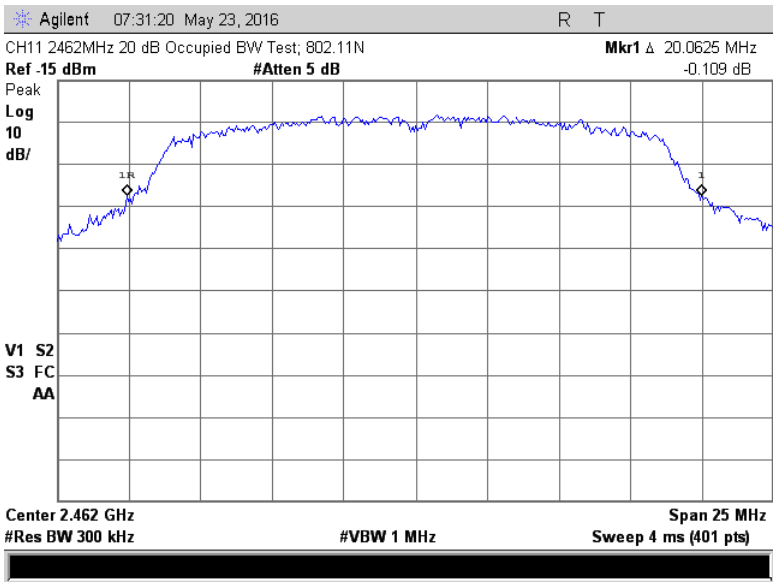




Channel 11 (20 dB)







11.3 Peak Output Power

The power output test method from ANSI C63.10-2013 section 11.9.1.2 was used for this test. The spectrum analyzer was set to peak channel power with a span of 20 MHz. The EUT antenna port was connected to the Spectrum analyzer Via a low loss coaxial cable.
Span = 25 MHz; RBW = 1 MHz; VBW = 3 MHz

Tested by: Joseph Strzelecki/Richard Tichgelaar
Test Date: May 24, 2016
Since the gain of the antenna is always less than 6 dB, the limit is not reduced. The antenna gain is 5 dBi.

Chan	Mode	EUT MHz	Peak Channel Power dBm	Cable Loss dB	Peak Power dBm	Limit dBm	Margin dB
1	802.11b	2412	15.9	0.7	16.6	30.0	13.4

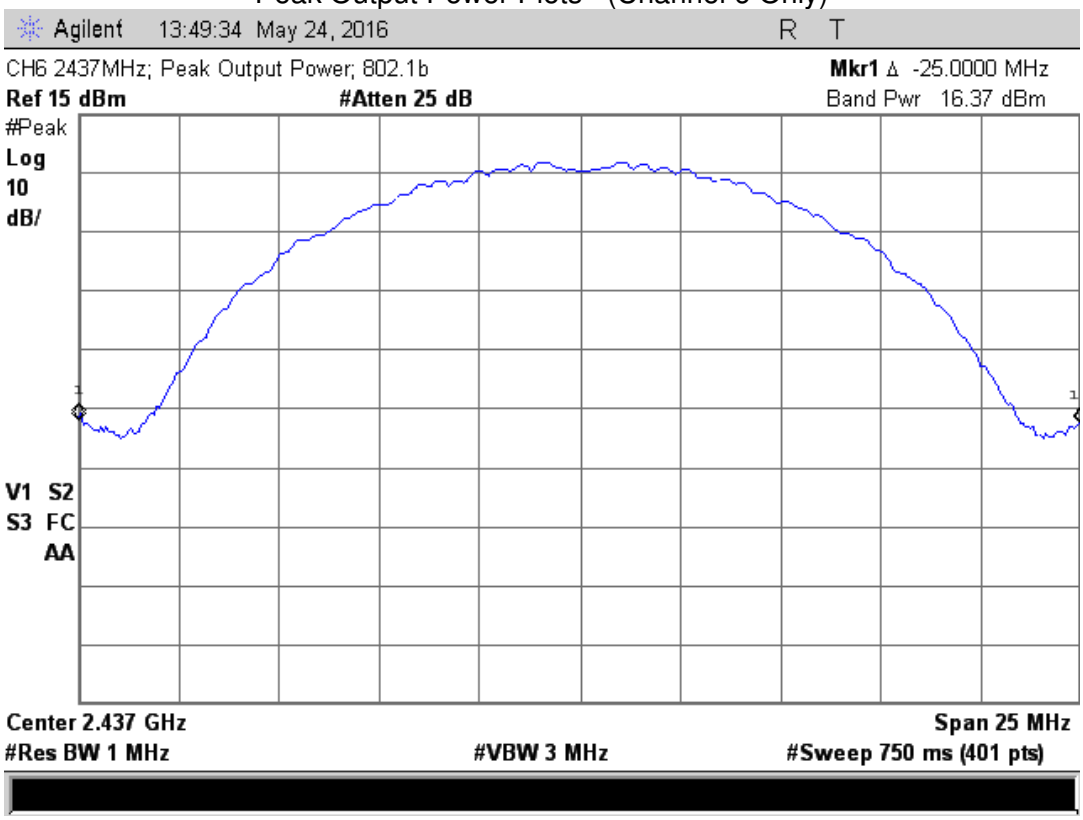
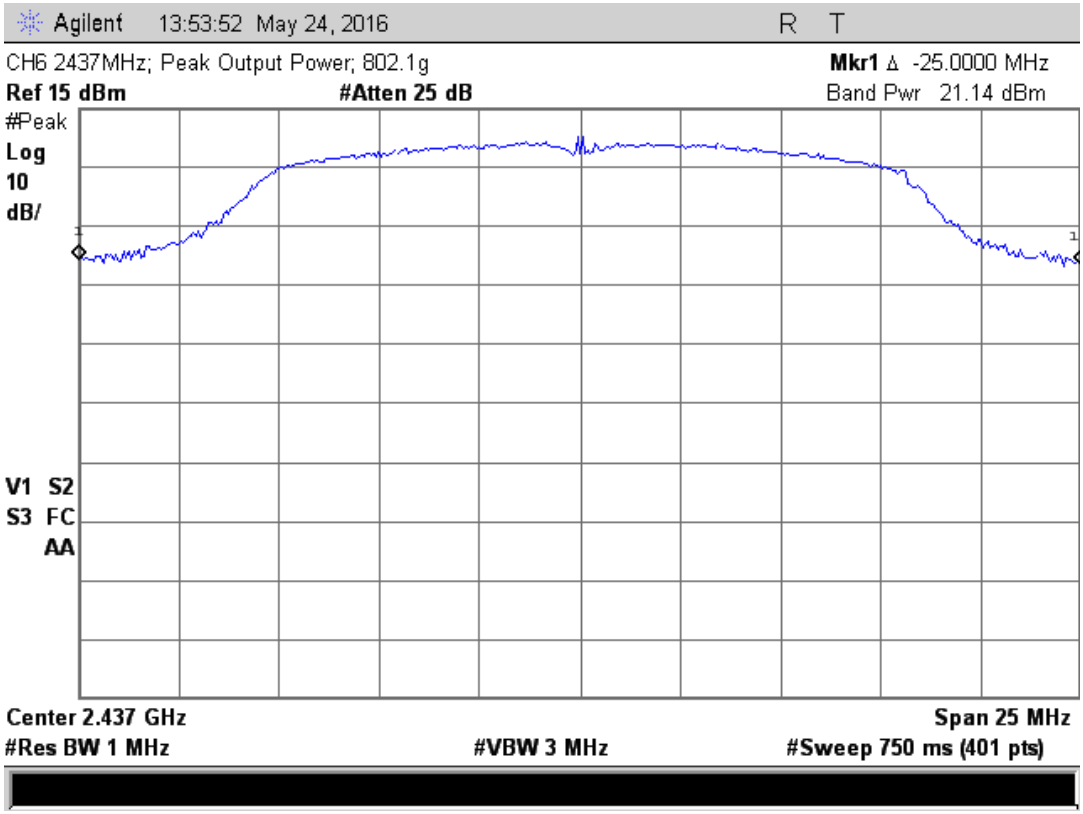
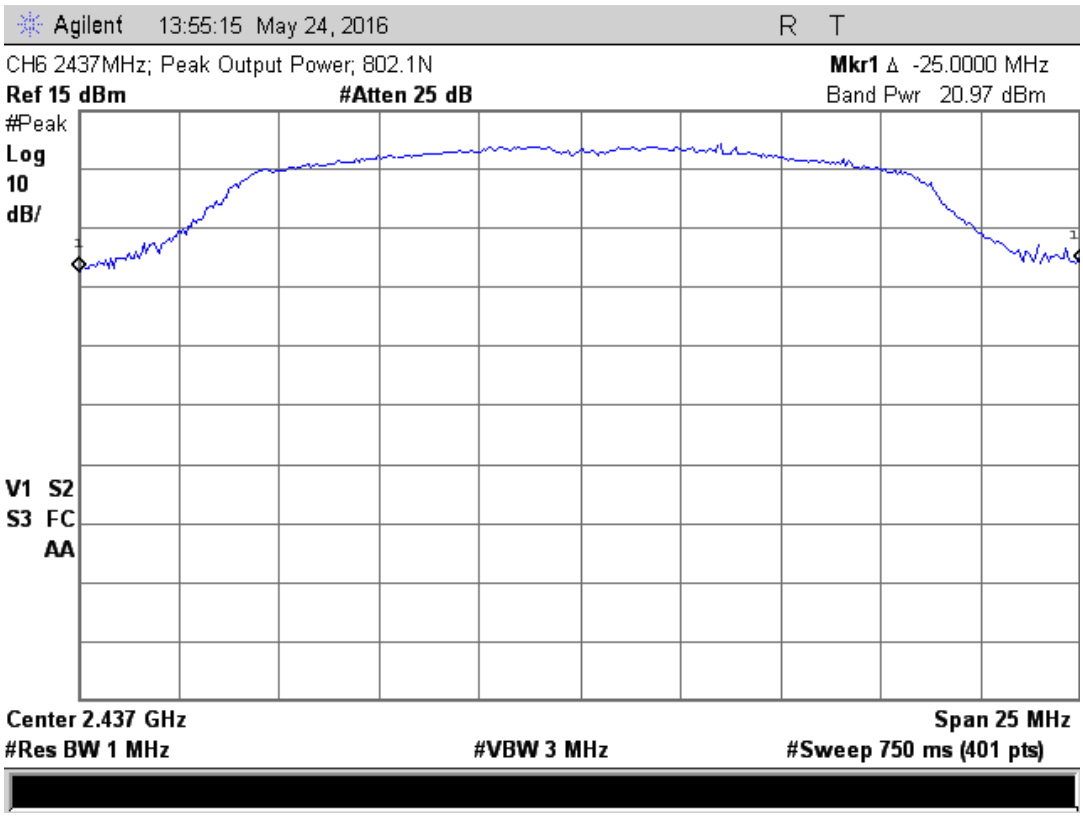
Judgment: Passed by 8.3 dB

Peak Output Power Plots (Channel 6 Only)







11.4 Average Output Power

The average power output test method from using 558074 D01, Section 9.2.2.7 was used for this test. The spectrum analyzer was set to channel power with a span of 20 MHz. The EUT antenna port was connected to the Spectrum analyzer Via a low loss coaxial cable.

Span = 25 MHz; RBW = 300 kHz; VBW = 300 Hz
Tested by: Richard Tichgelaar
Test Date: March 9, 2016

Chan	Mode	EUT MHz	Average Channel Power dBm	Cable Loss dB	Linear vs power factor dB	Ave power dBm	Power mW	Limit dBm

11.7 Spurious RF Conducted Emissions at Antenna Port

The spectrum analyzer was set to the MAX HOLD mode to record all spurious emissions from the lowest frequency generated in the EUT up through the 10th harmonic. The trace was allowed to stabilize. The first two plots were made while stepping through three frequencies (Low middle and high). Each frequency was on for 30 seconds. The display Line in pink is 20 dB below the fundamental measured with a 100 kHz RBW.

Judgement: Pass by at least 8 dB

11.8 Spurious Radiated Emissions (Restricted Band)

The procedures were in accordance to FCC DTS Measurement Guideline 558074 D01, Section 12.1 and ANSI C63.10.

Radiated emission measurements were performed with linearly polarized broadband antennas. The results obtained with these antennas can be correlated with results obtained with a tuned dipole antenna. The radiated emission measurements were performed with a spectrum analyzer. The bandwidth used from 150 kHz to 30 MHz is 9 or 10 kHz and the bandwidth from 30 MHz to 1000 MHz is 100 or 120 kHz. Above 1 GHz, a 1 MHz bandwidth is used. A 10 dB linearity check is performed prior to start of testing in order to determine if an overload condition exists.

For tests from 1 to 25 GHz, an E7405 spectrum analyzer was used. For tests from 1 to 10 GHz, a high pass filter was used to reduce the fundamental emission. High pass filters were not needed above 10 GHz, since the preamplifiers attenuated the fundamental emission. A harmonic mixer was used from 18 to 25 GHz. Figure 4 herein lists the details of the test equipment used during radiated emissions tests.

The was device was rotated through three orthogonal axis as per ANSI C63.10 during the radiated tests.

Final radiated emissions measurements were performed inside of an anechoic chamber at a test distance of 3 meters. The anechoic chamber is designated as Chamber E. This Chamber meets the Site Attenuation requirements of ANSI C63.4. Chamber E is located at 12 East Devonwood Ave. Romeoville, Illinois EMI test lab.

The entire frequency range from 30 to 25,000 MHz was slowly scanned with particular attention paid to those frequency ranges which appeared high. Measurements were performed using two antenna polarizations, (vertical and horizontal). The worst case emissions were recorded. All measurements may be performed using either the peak, average or quasi-peak detector functions. If the peak detector data exceeds or is marginally close to the limits, the measurements are repeated using a quasi-peak detector or average function as required by the specification for final determination of compliance.

The detected emission levels were maximized by rotating the EUT, adjusting the positions of all cables, and by scanning the measurement antenna from 1 to 4 meters above the ground.

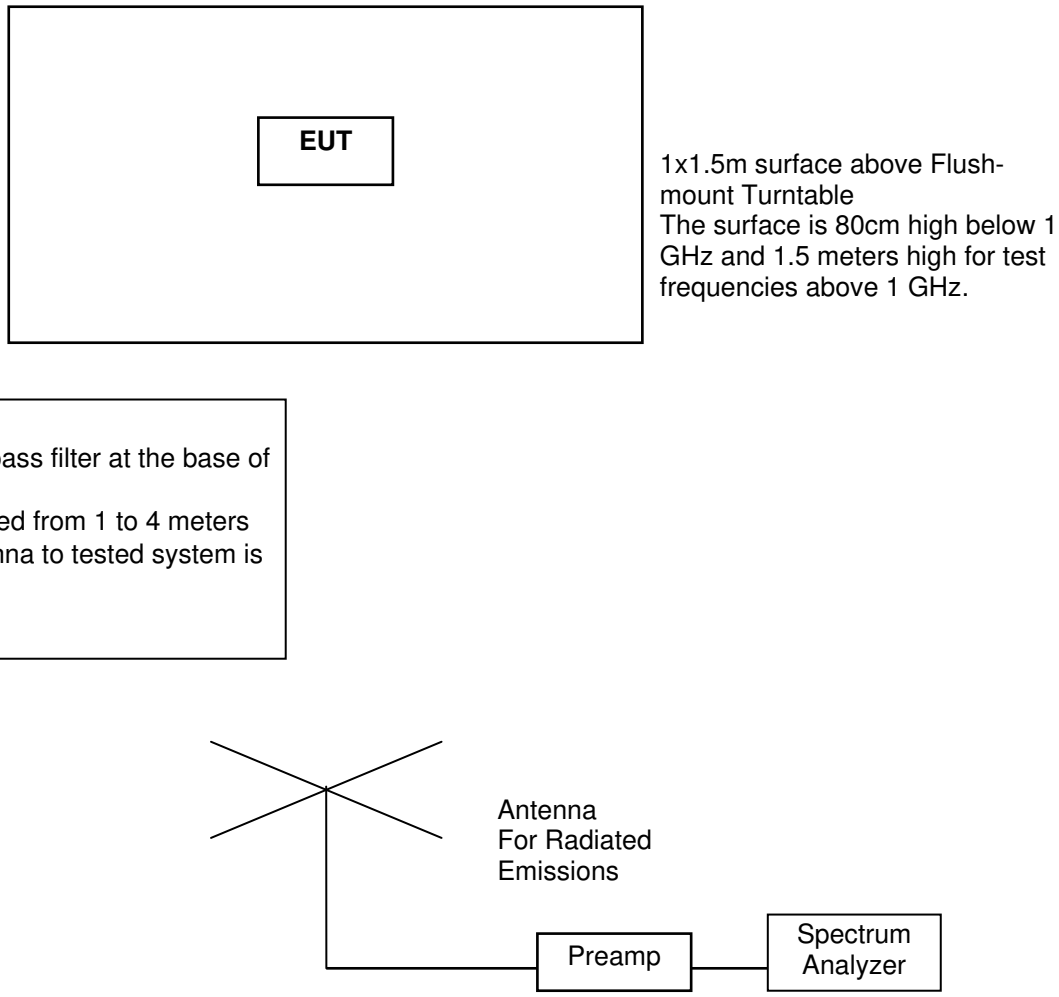
11.8.1 Radiated Emissions Field Strength Sample Calculation

The field strength is calculated by adding the Antenna Factor and Cable Loss, and by subtracting the Amplifier Gain from the measured reading. The basic equation is as follows:

FS = RA + AF + CF - AG

Where: FS = Field Strength
RA = Receiver Amplitude
AF = Antenna Factor
CF = Cable Attenuation Factor
AG = Amplifier Gain
HPF = High pass Filter Loss

Figure 2. Drawing of Radiated Emissions Setup



11.8.2 Spurious Radiated Emissions Test Results (Restricted Band)

The following spectrum analyzer settings were used.

Span = wide enough to fully capture the emission being measured
RBW = 1 MHz for f ≥ 1 GHz, 100 kHz for f < 1 GHz
VBW ≥ RBW
Sweep = auto
Detector function = peak
Trace = max hold

A Video Bandwidth of 10 Hz was used for Average measurements.
