7.5.3 TEST SETUP

Figure 90: Typical test setup for Conducted Test setup

7.5.4 TEST PROCEDURE

The Conducted test was performed using the Spectrum analyzer. Measurements were done as per Section 12.2 of KDB “558074 D01 DTS measurement Guidance v03r03”. The RF output of the EUT was connected to the input port of Spectrum analyzer using an attenuator. Captured the data from spectrum analyzer and performed required calculations to attain the Electric Field value and compared with the limits specified in the standard.

From 9 kHz to 1GHz, measurements have been performed with Peak detector. From 1GHz to 26.5GHz, measurements have been performed employing both Peak & Average detectors as specified in the standard. Detectors were selected based on FCC KDB document.

A Band reject filter (2400MHz to 2483.5MHz) offering an attenuation of approximately 40dB was used to attenuate the intentional band during the testing.

7.6.4 TEST PROCEDURE

The Conducted test was performed using the Spectrum analyzer. Measurements were done as per Section 13 of KDB “558074 D01 DTS measurement Guidance v03r02”. The RF output of the EUT was connected to the input port of Spectrum analyzer using an attenuator. Captured the data from spectrum analyzer and compared with the limits specified in the standard.
