## Technical Description

The CC2541ARC is an evaluation board for the CC2541 chip from Texas Instruments.

The CC2541ARC is included in a development kit that can be used as for Bluetooth Low Energy development.

The CC2541 System on Chip has a differential RF output. On the CC2541ARC board this differential output is transformed to a single ended, 50 ohm signal through a discrete balun. Additionally, the balun ha greatly reduces harmonic radiation. The single ended output of the balun is connected to an on-board PCB antenna.
