

# TEST REPORT No.I23Z70153-WMD01

for

Samsung Electronics Co., Ltd.

Multi-band GSM/WCDMA/LTE Phone with Bluetooth, WLAN

Model Name: SM-A055F/DS SM-A055F

FCC ID: ZCASMA055F

with

Hardware Version: REV1.0

Software Version: A055F.001

Issued Date: 2023-08-10

#### Note:

The test results in this test report relate only to the devices specified in this report. This report shall not be reproduced except in full without the written approval of CTTL.

The report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S.Government.

## 1. Test Laboratory

## 1.1. Introduction & Accreditation

Telecommunication Technology Labs, CAICT is an ISO/IEC 17025:2017 accredited test laboratory under NATIONAL VOLUNTARY LABORATORY ACCREDITATION PROGRAM (NVLAP) with lab code 600118-0 and is also an FCC accredited test laboratory (CN5017), and ISED accredited test laboratory (ISED#: 24849). The detail accreditation scope can be found on NVLAP website.

## 1.2. Testing Location

Location 1: CTTL (huayuan North Road)

Address: No. 52, Huayuan North Road, Haidian District, Beijing,

P. R. China 100191

Location 2: CTTL (BDA)

Address: No.18A, Kangding Street, Beijing Economic-Technology

Development Area, Beijing, P. R. China 100176

## 1.3. <u>Testing Environment</u>

Normal Temperature:  $15-35^{\circ}$ C Relative Humidity: 20-75%

## 1.4. Project Data

Testing Start Date: 2023-07-21
Testing End Date: 2023-08-09

## 1.5. Signature

Dong Yuan
(Prepared this test report)

Zhou Yu (Reviewed this test report)

赵慧麟

Zhao Hui Lin
Deputy Director of the laboratory
(Approved this test report)

# 2. Client Information

## 2.1. Applicant Information

Company Name: Samsung Electronics Co., Ltd.

Address /Post: 19 Chapin Rd., Building D Pine Brook, NJ 07058

Contact: Jenni Chun

Email: j1.chun@samsung.com

Telephone: +1-201-937-4203

## 2.2. Manufacturer Information

Company Name: Samsung Electronics Co., Ltd.

Address /Post: Samsung R5, Maetan dong 129, Samsung ro

Youngtong gu, Suwon city 443 742, Korea

Contact: Sunghoon Cho

Email: ggobi.cho@samsung.com

Telephone: +82-10-2722-4159

# 3. Equipment Under Test (EUT) and Ancillary Equipment (AE)

## 3.1. About EUT

Description Multi-band GSM/WCDMA/LTE Phone with Bluetooth, WLAN

Model Name SM-A055F/DS SM-A055F

FCC ID ZCASMA055F Antenna Embedded

Output power 28.78 dBm maximum EIRP measured for GSM850

Extreme vol. Limits 3.55VDC to 4.4VDC (nominal: 3.85VDC)

Extreme temp. Tolerance -10°C to +55°C

Note: Components list, please refer to documents of the manufacturer; it is also included in the original test record of CTTL.

## 3.2. Internal Identification of EUT used during the test

EUT ID*	SN	<b>HW Version</b>	SW Version	Date of receipt
UT01a	2370153UT01a	REV1.0	A055F.001	2023-07-21
UT06a	2370153UT06a	REV1.0	A055F.001	2023-07-21

<sup>\*</sup>EUT ID: is used to identify the test sample in the lab internally.

## 3.3. Internal Identification of AE used during the test

# AE ID\* Description AE1 Battery

AE1

Model WT-S-N28

Manufacturer SCUD(Fujian)Electronics Co., Ltd

Capacitance 5000mAh

<sup>\*</sup>AE ID: is used to identify the test sample in the lab internally.

# 4. Reference Documents

## 4.1. <u>Documents supplied by applicant</u>

EUT parameters are supplied by the customer, which are the bases of testing. CAICT is not responsible for the accuracy of customer supplied technical information that may affect the test results (for example, antenna gain and loss of customer supplied cable).

## 4.2. Reference Documents for testing

The following documents listed in this section are referred for testing.

Reference	Title	Version
FCC Part 22	PUBLIC MOBILE SERVICES	10-1-22
		Edition
ANSI/TIA-603-E	Land Mobile FM or PM Communications Equipment	2016
	Measurement and Performance Standards	
ANSI C63.26	American National Standard for Compliance Testing of	2015
	Transmitters Used in Licensed Radio Services	
KDB 971168 D01	MEASUREMENT GUIDANCE FOR CERTIFICATION OF	v03r01
	LICENSED DIGITAL TRANSMITTERS	

# 5. Summary Of Test Result

#### **GSM850**

Items	Test Name	Clause in FCC rules	Verdict	
1	Output Power	22.913	Р	
2	Emission Limit	2.1051/22.917 P		
3	Frequency Stability	2.1055	Р	
4	Occupied Bandwidth	2.1049	Р	
5	Emission Bandwidth	22.917	Р	
6	Band Edge Compliance	22.917	Р	
7	Conducted Spurious Emission	22.917	Р	

#### Terms used in Verdict column

Р	Pass. The EUT complies with the essential requirements in the standard.				
NP	Not Performed. The test was not performed by CTTL.				
NA	Not Applicable. The test was not applicable.				
BR	Re-use test data from basic model report.				
F	Fail. The EUT does not comply with the essential requirements in the				
	standard.				

All the test results are based on normal power.

## Explanation of worst-case configuration

The worst-case scenario for all measurements is based on the conducted output power measurement investigation results unless otherwise stated. The test results shown in the following sections represent the worst case emission.

# 6. Test Equipments Utilized

## **Annex A: Measurement Results**

## **A.1 Output Power**

#### A.1.1 Summary

During the process of testing, the EUT was controlled via communication tester to ensure max power transmission and proper modulation.

In all cases, output power is within the specified limits.

#### A.1.2 Conducted

#### A.1.2.1 Method of Measurements

The EUT was set up for the max output power with pseudo random data modulation.

These measurements were done at 3 frequencies (bottom, middle and top of operational frequency range) for each bandwidth.

The results below include a correction factor for cable loss that is provided by the customer.

#### A.1.2.2 Measurement Result

#### **GSM850**

#### GSM(GMSK)

Frequency (MHz)	Power Step	Output power (dBm)
824.2	5	32.49
836.6	5	32.51
848.8	5	32.46

#### GPRS(GMSK,1Slot)

		,	
Frequency (MHz) Power Step			Output power (dBm)
	824.2	3	32.49
	836.6	3	32.51
	848.8	3	32.49

## EGPRS(8PSK,1Slot)

Frequency (MHz)	Power Step	Output power (dBm)
824.2	6	25.73
836.6 6		25.79
848.8	6	25.80

Note: Expanded measurement uncertainty is U = 0.578 dB, k = 2.

#### A.1.3 Radiated

#### A.1.3.1 Description

This is the test for the maximum radiated power from the EUT.

Part 22.913(a) specifies "The ERP of mobile transmitters and auxiliary test transmitters must not exceed 7 watts".

#### A.1.3.2 Method of Measurement

The measurements procedures in ANSI C63.26 are used.

1. EUT was placed on a 0.8/1.5 meter high non-conductive stand at a 3 meter test distance from the receive antenna. A receiving antenna was placed on the antenna mast 3 meters from the EUT for emission measurements. The receiving antenna shall be varied from 1 to 4m in height above the reference ground. The test setup refers to figure below. Detected emissions were maximized at each frequency by rotating the EUT through 360° and the EUT is manipulated through all orthogonal planes representative of its typical use. The test is carried out with both vertical and horizontal polarization of the receiving antenna. The radiated emission measurements of all transmit frequencies in three channels (High, Middle, Low) were measured with rms detector.

- 2. The EUT is then put into continuously transmitting mode at its maximum power level during the test. And the maximum value of the receiver should be recorded as (Pr).
- 3. The EUT shall be replaced by a substitution antenna. The test setup refers to figure below.

In the chamber, a substitution antenna for the frequency band of interest is placed at the reference point of the chamber. An RF Signal source for the frequency band of interest is connected to the substitution antenna with a cable that has been constructed to not interfere with the radiation pattern of the antenna. A power ( $P_{Mea}$ ) is applied to the input of the substitution antenna and adjusts the level of the signal generator output until the value of the receiver reach the previously recorded ( $P_r$ ). The power of signal source ( $P_{Mea}$ ) is recorded. The test should be performed by rotating the test item and adjusting the receiving antenna polarization.

4. An amplifier should be connected to the Signal Source output port. And the cable should be connected between the Amplifier and the Substitution Antenna.

The cable loss (P<sub>cl</sub>), the Substitution Antenna Gain (G<sub>a</sub>) and the Amplifier Gain (P<sub>Ag</sub>) should be recorded after test.

The measurement results are obtained as described below:

Power (EIRP) = 
$$P_{Mea} + P_{Ag} - P_{cl} + G_a$$

- 5. This value is EIRP since the measurement is calibrated using an antenna of known gain (2.15 dBi) and known input power.
- 6. ERP can be calculated from EIRP by subtracting the gain of the dipole, ERP = EIRP -2.15dBi.

The antenna gain provided by the client may affect the validity of the measurement results in this report, and the client shall bear the impact and consequences arising therefrom.

#### **GSM 850-ERP**

## Limits

Modulation	Power Step	Burst Peak ERP (dBm)
GSM	5	≤38.45dBm (7W)
GPRS	3	≤38.45dBm (7W)
EGPRS	6	≤38.45dBm (7W)

#### **Measurement result**

#### **GSM**

Frequency	P <sub>Mea</sub>	Pcl	$P_{Ag}$	Ga	Correction	ERP	Limit	Margin	Polarization
(MHz)	(dBm)	(dB)	(dB)	(dBi)	(dB)	(dBm)	(dBm)	(dB)	Polanzation
824.20	-16.87	2.26	45.79	0.96	2.15	25.47	38.45	12.98	V
836.60	-15.05	2.26	45.66	0.82	2.15	27.02	38.45	11.43	Н
848.80	-13.19	2.28	45.54	0.79	2.15	28.71	38.45	9.74	Н

#### **GPRS**

Frequency	P <sub>Mea</sub>	P <sub>cl</sub>	$P_{Ag}$	Ga	Correction	ERP	Limit	Margin	Polarization
(MHz)	(dBm)	(dB)	(dB)	(dBi)	(dB)	(dBm)	(dBm)	(dB)	Polarization
824.20	-16.86	2.26	45.79	0.96	2.15	25.48	38.45	12.97	V
836.60	-15.05	2.26	45.66	0.82	2.15	27.02	38.45	11.43	Н
848.80	-13.12	2.28	45.54	0.79	2.15	28.78	38.45	9.67	Н

#### **EGPRS-8PSK**

Frequency	P <sub>Mea</sub>	P <sub>cl</sub>	P <sub>Ag</sub>	Ga	Correction	ERP	Limit	Margin	Polarization
(MHz)	(dBm)	(dB)	(dB)	(dBi)	(dB)	(dBm)	(dBm)	(dB)	Polarization
824.20	-22.74	2.26	45.79	0.96	2.15	19.60	38.45	18.85	V
836.60	-21.73	2.26	45.66	0.82	2.15	20.34	38.45	18.11	Н
848.80	-20.80	2.28	45.54	0.79	2.15	21.10	38.45	17.35	Н

Frequency: 848.80MHz

 $Peak \; ERP \; (dBm) = P_{Mea}(-20.80dBm) - P_{cl}(2.28dB) + P_{Ag}(45.54dB) + G_a \; (0.79dB) - 2.15dB = 21.10dBm \; (0.79dB) - 2.15dBm \; (0.79dB)$ 

Note: Expanded measurement uncertainty is U = 5.76 dB, k = 2.

### **A.2 Emission Limit**

#### A.2.1 Measurement Method

The measurement procedures in ANSI C63.26 are used.

The spectrum was scanned from 9 kHz to the 10th harmonic of the highest frequency generated within the equipment. The resolution bandwidth is set as outlined in Part 22.917. The spectrum is scanned with the mobile station transmitting at carrier frequencies that pertain to low, mid and high channels of GSM850.

#### The procedure of radiated spurious emissions is as follows:

For measurements performed at frequencies less than or equal to 1 GHz, the EUT was placed on a 80cm-high non-conductive support; For measurements performed at frequencies above 1GHz, EUT was placed on a 1.5-meter-high non-conductive support. A measurement antenna was placed on the antenna mast 3 meters from the EUT for emission measurements. In the initial test, the height of the measurement antenna was varied from 1 m to 4 m for the relative positioning that produces the maximum radiated signal level. The test setup refers to figure below. Detected emissions were maximized at each frequency by rotating the EUT through 360° and adjusting the receiving antenna polarization. The radiated emission measurements of all non-harmonic and harmonics of the transmit frequency through the 10th harmonic were measured with peak detector.

- 1. The EUT is then put into continuously transmitting mode at its maximum power level during the test. And the maximum value of the receiver should be recorded as (Pr).
- 2. The EUT shall be replaced by a substitution antenna. The test setup refers to figure below.

In the chamber, a substitution antenna for the frequency band of interest is placed at the reference point of the chamber. An RF Signal source for the frequency band of interest is connected to the substitution antenna with a cable that has been constructed to not interfere with the radiation pattern of the antenna. The height of measurement antenna varied between 1 m to 4 m to maximize the received signal amplitude for each emission that was detected and measured in the initial test. A power ( $P_{Mea}$ ) is applied to the input of the substitution antenna and adjusts the level of the signal generator output until the value of the receiver reach the previously recorded ( $P_r$ ). The power of signal source ( $P_{Mea}$ ) is recorded. The test was performed with the measurement antenna in both vertical and horizontal polarization.

- 3. The Path loss (P<sub>pl</sub>) between the Signal Source and the Substitution Antenna and the Substitution Antenna Gain (G<sub>a</sub>) were recorded after test. A amplifier was connected in for the test. The Path loss (P<sub>pl</sub>) is the summation of the cable loss and the gain of the amplifier.
- 4. The measurement results are obtained as described below:

Power (EIRP) = 
$$P_{Mea} - P_{pl} + G_a$$

This value is EIRP since the measurement is calibrated using an antenna of known gain (2.15 dBi) and known input power.ERP can be calculated from EIRP by subtracting the gain of the dipole, ERP = EIRP -2.15dBi.

#### A.2.2 Measurement Limit

Part 22.917 specifies that the power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least 43 + 10 log(P) dB.

#### A.2.3 Measurement Results

Radiated emissions measurements were made only at the upper, middle, and lower carrier frequencies of the GSM850 band (824.2MHz, 836.6MHz, and 848.8MHz). It was decided that measurements at these three carrier frequencies would be sufficient to demonstrate compliance with emissions limits because it was seen that all the significant spurs occur well outside the band and no radiation was seen from a carrier in one block of the GSM850 into any of the other blocks. The equipment must still, however, meet emissions requirements with the carrier at all frequencies over which it is capable of operating and it is the manufacturer's responsibility to verify this. The range of evaluated frequency is from 9 kHz to 10<sup>th</sup> harmonic; measurement value listed in this report is the 6 maximum emissions.

#### A.2.4 Measurement Results Table

Frequency	Channel	Frequency Range	Result
	Low	9kHz-10GHz	Pass
GSM 850MHz	Middle	9kHz-10GHz	Pass
	High	9kHz-10GHz	Pass

#### A.2.5 Sweep Table

Subrange	RBW	VBW
9~150 kHz	0.2kHz	0.6kHz
150kHz~30MHz	9kHz	27kHz
30MHz~1 GHz	100KHz	300KHz
1~10 GHz	1 MHz	3 MHz

## **A.2.6 Measurement Result**

#### **GSM Mode Channel 128/824.2MHz**

Frequency (MHz)	P <sub>Mea</sub> (dBm)	Path Loss(dB)	Antenna Gain(dBi)	Correction (dB)	Peak ERP (dBm)	Limit (dBm)	Margin (dB)	Polarization

5944.01	-57.48	7.47	10.50	2.15	-56.60	-13.00	43.60	V

Note: Peak EIRP (dBm) = PMea(dBm) - Path Loss(dB) + Antenna Gain(dBi)

Note: Expanded measurement uncertainty is U = 5.76 dB, k = 2.

## A.3 Frequency Stability

#### A.3.1 Method of Measurement

Frequency stability is a measure of the frequency drift due to temperature and supply voltage variations, with reference to the frequency measured at +20 °C and rated supply voltage. Two reference points are established at the applicable unwanted emissions limit using a RBW equal to the RBW required by the unwanted emissions specification of the applicable regulatory standard. These reference points measured using the lowest and highest channel of operation shall be identified as  $F_L$  and  $F_H$  respectively.

In order to measure the carrier frequency under the condition of AFC lock, it is necessary to make measurements with the EUT in a "call mode". This is accomplished with the use of CMU200.

- 1. Measure the carrier frequency at room temperature.
- 2. Subject the EUT to overnight soak at -30℃.
- 3. With the EUT, powered via nominal voltage, connected to the CMU200 and in a simulated call on mid channel of each band, measure the carrier frequency. These measurements should be made within 2 minutes of Powering up the EUT, to prevent significant self-warming.
- 4. Repeat the above measurements at 10°C increments from -30°C to +50°C. Allow at least 1.5 hours at each temperature, unpowered, before making measurements.
- 5. Remeasure carrier frequency at room temperature with nominal voltage. Vary supply voltage from minimum voltage to maximum voltage, in 0.1Volt increments remeasuring carrier frequency at each voltage. Pause at nominal voltage for 1.5 hours unpowered, to allow any self-heating to stabilize, before continuing.
- 6. Subject the EUT to overnight soak at  $+50^{\circ}$ C.
- 7. With the EUT, powered via nominal voltage, connected to the CMU200 and in a simulated call on the centre channel, measure the carrier frequency. These measurements should be made within 2 minutes of Powering up the EUT, to prevent significant self-warming.
- 8. Repeat the above measurements at 10 ℃ decrements from +50 ℃ to -30 ℃. Allow at least 1.5 hours at each temperature, unpowered, before making measurements.
- 9. At all temperature levels hold the temperature to +/- 0.5°C during the measurement procedure.

The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block. As this transceiver is considered "Hand carried, battery powered equipment" Section 2.1055(d)(2) applies. This requires that the lower voltage for frequency stability testing be specified by the manufacturer. This transceiver is specified to operate with an input voltage of the lower, higher and nominal voltage. Operation above or below these voltage limits is prohibited by transceiver software in order to prevent improper operation as well as to protect components from overstress.

## Frequency Error vs Voltage

Voltage(V)	Temperature(°C)	F <sub>L</sub> (MHz)	F <sub>H</sub> (MHz)	Offset(Hz)	Frequency error(ppm)
3.55	20	824.029	848.971	-2.58	0.0031
4.4	20	024.029	040.97 1	-0.45	0.0005

Note: Expanded measurement uncertainty is U = 0.01 PPM, k = 2.

#### A.4 Occupied Bandwidth

Occupied bandwidth measurements are only provided for selected frequencies in order to reduce the amount of submitted data. Data were taken at the extreme and mid frequency. The table below lists the measured 99% BW. Spectrum analyzer plots are included on the following pages. The measurement method is from ANSI C63.26:

- a) The spectrum analyzer center frequency is set to the nominal EUT channel center frequency. The frequency span for the spectrum analyzer shall be set wide enough to capture all modulation products including the emission skirts.
- b) The nominal IF filter 3 dB bandwidth (RBW) shall be in the range of 1% to 5% of the anticipated OBW, and the VBW shall be set ≥ 3 × RBW.
- c) Set the reference level of the instrument as required to prevent the signal amplitude from exceeding the maximum spectrum analyzer input mixer level for linear operation.
- d) Set the detection mode to peak, and the trace mode to max-hold.

## **GSM 850 (99%)**

Frequency (MHz)	Occupied Bandwidth (99%)(kHz)
824.2	244.39
836.6	245.19
848.8	245.19

# Channel 251-Occupied Bandwidth (99% BW)

Date: 24.JUL.2023 10:05:56

Note: Expanded measurement uncertainty is U = 3428 Hz, k = 2.

#### A.5 Emission Bandwidth

The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

The measurement method is from ANSI C63.26:

- a) The spectrum analyzer center frequency is set to the nominal EUT channel center frequency. The span range for the spectrum analyzer shall be wide enough to see sufficient roll off of the signal to make the measurement.
- b) The nominal RBW shall be in the range of 1% to 5% of the anticipated OBW, and the VBW shall be set ≥ 3 × RBW.
- c) Set the reference level of the instrument as required to prevent the signal amplitude from exceeding the maximum spectrum analyzer input mixer level for linear operation.
- d) The dynamic range of the spectrum analyzer at the selected RBW shall be more than 10 dB below the target "−X dB" requirement, i.e., if the requirement calls for measuring the −26 dB OBW, the spectrum analyzer noise floor at the selected RBW shall be at least 36 dB below the reference level.
- e) Set spectrum analyzer detection mode to peak, and the trace mode to max hold.

## GSM 850 (-26dBc)

Note: Expanded measurement uncertainty is U = 3428 Hz, k = 2.

# A.6 Band Edge Compliance

#### A.6.1 Measurement limit

Part 22.917 specifies that the power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least 43 + 10 log(P) dB.

According to KDB 971168, a relaxation of the reference bandwidth is often provided for measurements within a specified frequency range at the edge of the authorized frequency block/band. This is often implemented by permitting the use of a narrower RBW (typically limited to a minimum RBW of 1% of the OBW) for measuring the out-of-band emissions without a requirement to integrate the result over the full reference bandwidth.

The spectrum analyzer readings are corrected by [10 log (1/duty cycle)] for the non-continuous transmitting scenario.

Date: 24.JUL.2023 09:55:30

#### Channel 251

Date: 24.JUL.2023 10:02:40

Note: Expanded measurement uncertainty is U = 0.622 dB, k = 2.

## **A.7 Conducted Spurious Emission**

#### A.7.1 Measurement Method

The following steps outline the procedure used to measure the conducted emissions from the EUT.

- 1. In measuring unwanted emissions, the spectrum shall be investigated from 30 MHz or the lowest radio frequency signal generated in the equipment, whichever is lower, without going below 9 kHz, up to at least the frequency given below:
  - (a) If the equipment operates below 10 GHz: to the tenth harmonic of the highest fundamental frequency or to 40 GHz, whichever is lower.
  - (b) If the equipment operates at or above 10 GHz: to the fifth harmonic of the highest fundamental frequency or to 100 GHz, whichever is lower.
- 2. Determine EUT transmit frequencies: below outlines the band edge frequencies pertinent to conducted emissions testing.
- 3. The number of sweep points of spectrum analyzer is greater than 2×span/RBW.

#### A. 7.2 Measurement Limit

Part 22.917 specifies that the power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least 43 + 10 log(P) dB.

#### A.7.3 Measurement result

#### **GSM850**

Channel 128: 30MHz - 8.49GHz

NOTE: peak above the limit line is the carrier frequency.

NOTE: peak above the limit line is the carrier frequency.

Date: 24.JUL.2023 09:41:26

## Channel 251: 30MHz - 8.49GMHz

## NOTE: peak above the limit line is the carrier frequency.

Date: 24.JUL.2023 09:41:57

Note: Expanded measurement uncertainty is U = 0.622 dB, k = 2.

# **Annex B: Accreditation Certificate**

United States Department of Commerce National Institute of Standards and Technology

# Certificate of Accreditation to ISO/IEC 17025:2017

NVLAP LAB CODE: 600118-0

#### Telecommunication Technology Labs, CAICT

Beijing China

is accredited by the National Voluntary Laboratory Accreditation Program for specific services, listed on the Scope of Accreditation, for:

#### **Electromagnetic Compatibility & Telecommunications**

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017.

This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to joint ISO-ILAC-IAF Communique dated January 2009).

2022-10-01 through 2023-09-30

Effective Dates
