EMC Engineer

TEST REPORT

Applicant Name : Dragino Technology Co., Limited.

Address: Room 202, BaoCheng Tai industrial park, No. 8 Cai Yun,

LongCheng Street, LongGang District, Shenzhen, China

Report Number: SZNS220901-39736E-RF-00B

FCC ID: ZHZWTS

Test Standard (s) FCC PART 15.247

Sample Description

Product Type: WTS Model No.: WTS-10

Multiple Model(s) No.: WTS-11,WTS-12

Trade Mark: DRAGINO
Date Received: 2022/09/01
Report Date: 2022/10/14

Test Result: Pass*

Prepared and Checked By:

EMC Engineer

GENERAL INFORMATION

Product Description for Equipment under Test (EUT)

| Toduct Description for E | quipment under Test (EUT) |
|-------------------------------------|--|
| Product | WTS |
| Tested Model | WTS-10 |
| Multiple Models | WTS-11,WTS-12 (model difference see product declaration letter of similarity) |
| Frequency Range | 903-914.2MHz |
| Maximum Conducted Peak Output Power | 2.17dBm |
| Technique | DTS |
| Antenna Specification* | 2dBi (provide by applicant) |
| Voltage Range | DC3.6V from battery |
| Sample serial number | RF Conducted Test: SZNS220901-39736E-RF-S2 Radiated Emission Test: SZNS220901-39736E-RF-S1 (WTS-10), SZNS220901-39736E-RF-S8 (WTS-11), SZNS220901-39736E-RF-S7(WTS-12) (Assigned by ATC) |
| Sample/EUT Status | Good condition |
| Note: For radiated emission te | st (above 1GHz) and conducted test, pre-scan all models, the worst case model |

Report No.: SZNS220901-39736E-RF-00B

WTS-10 was selected to test.

Objective

This test report is in accordance with Part 2-Subpart J, Part 15-Subparts A and C of the Federal Communication Commission's rules.

The tests were performed in order to determine compliance with FCC Part 15, Subpart C, and section 15.203, 15.205, 15.209 and 15.247 rules.

Test Methodology

All measurements contained in this report were conducted with ANSI C63.10-2013, American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices.

And KDB 558074 D01 15.247 Meas Guidance v05r02.

All emissions measurement was performed at Shenzhen Accurate Technology Co., Ltd. The radiated testing was performed at an antenna-to-EUT distance of 3 meters.

Each test item follows test standards and with no deviation.

Measurement Uncertainty

| Parameter | | Uncertainty | |
|------------------------|-------------------|-------------|--|
| Occupied Cha | nnel Bandwidth | 5% | |
| RF output po | wer, conducted | 0.73dB | |
| Unwanted Em | ission, conducted | 1.6dB | |
| AC Line Con | ducted emission | 2.72dB | |
| . | 30MHz – 1GHz | 4.28dB | |
| Emissions, Radiated | 1GHz – 18GHz | 4.98dB | |
| Radiated | 18GHz – 26.5GHz | 5.06dB | |
| Temperature | | 1℃ | |
| Humidity | | 6% | |
| Supply | voltages | 0.4% | |

Note: The extended uncertainty given in this report is obtained by combining the standard uncertainty times the coverage factor K with the 95% confidence interval. Otherwise required by the applicant or Product Regulations, Decision Rule in this report did not consider the uncertainty.

Test Facility

The test site used by Shenzhen Accurate Technology Co., Ltd. To collect test data is located on the 1/F., Building A, Changyuan New Material Port, Science & Industry Park, Nanshan District, Shenzhen, Guangdong, P.R. China.

The test site has been approved by the FCC under the KDB 974614 D01 and is listed in the FCC Public Access Link (PAL) database, FCC Registration No.: 708358, the FCC Designation No.: CN1189. Accredited by American Association for Laboratory Accreditation (A2LA) The Certificate Number is 429 7.01.

Listed by Innovation, Science and Economic Development Canada (ISEDC), the Registration Number is 5077A.

SYSTEM TEST CONFIGURATION

Description of Test Configuration

The system was configured for testing in engineering mode.

Channel list:

| Channel | Freq.(MHz) | Channel | Freq.(MHz) | Channel | Freq.(MHz) | Channel | Freq.(MHz) |
|---------|------------|---------|------------|---------|------------|---------|------------|
| 64 | 903 | 65 | 904.6 | 66 | 906.2 | 67 | 907.8 |
| 68 | 909.4 | 69 | 911 | 70 | 912.6 | 71 | 914.2 |

Report No.: SZNS220901-39736E-RF-00B

EUT was test with channel 64/67/71

EUT Exercise Software

"serial_port_utility.exe" software was used to the EUT tested and power level is 12, the software and power level was provided by the applicant.

Equipment Modifications

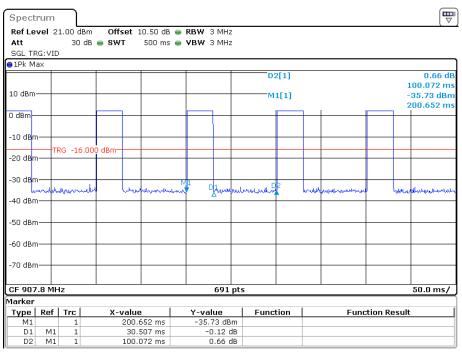

No modification was made to the EUT tested.

Special Accessories

No special accessory.

Duty cycle

| Mode | Ton (ms) | Ton+off (ms) | Duty Cycle |

^{*} Statement of Traceability: Shenzhen Accurate Technology Co., Ltd. attests that all calibrations have been performed in accordance to requirements that traceable to National Primary Standards and International System of Units (SI).

FCC §15.247 (i) & §2.1091- MAXIMUM PERMISSIBLE EXPOSURE (MPE)

Report No.: SZNS220901-39736E-RF-00B

Applicable Standard

According to subpart 15.247 (i) and subpart 2.1091 systems operating under the provisions of this section shall be operated in a manner that ensures the public is not exposed to RF energy level in excess of the communication guidelines.

According to KDB 447498 D04 Interim General RF Exposure Guidance

MPE-Based Exemption:

General frequency and separation-distance dependent MPE-based effective radiated power(ERP) thresholds are in Table B.1 [Table 1 of § 1.1307(b)(1)(i)(C)] to support an exemption from further evaluation from 300 kHz through 100 GHz.

Table 1 to § 1.1307(b)(3)(i)(C) - Single RF Sources Subject to Routine Environmental Evaluation

| RF Source frequency (MHz) | Threshold ERP (watts) |
|---------------------------------|--------------------------|
| 0.3-1.34 | 1,920 R ² . |
| 1.34-30 | $3,450 R^2/f^2$. |
| 30-300 | 3.83 R ² . |
| 300-1,500 | $0.0128 R^2 f.$ |
| 1,500-100,000 | 19.2R ² . |

Ris the minimum separation distance in meters f = f frequency in MHz

Result

| Mode | Frequency (MHz) | Tune up conducted power | Antenna Gain ERP | | Evaluation Distance | ERP Limit | | |
|------|--------------------|-------------------------------|------------------|-------|------------------------|--------------|-----|-------|
| | , | (dBm) | (dBi) | (dBd) | (dBm) (W) | | (m) | (W) |
| DTS | 903-914.2 | 2.5 | 2.0 | -0.15 | 2.35 | 0.0017 | 0.2 | 0.462 |

Note: 1. The tune up conducted power and antenna gain was declared by the applicant.

2. 0dBd=2.15dBi

To maintain compliance with the FCC's RF exposure guidelines, place the equipment at least 20cm from nearby persons.

Result: Compliant.

FCC §15.203 - ANTENNA REQUIREMENT

Applicable Standard

According to § 15.203, an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the user of a standard antenna jack or electrical connector is prohibited. The structure and application of the EUT were analyzed to determine compliance with section §15.203 of the rules. §15.203 state that the subject device must meet the following criteria:

Report No.: SZNS220901-39736E-RF-00B

- a. Antenna must be permanently attached to the unit.
- b. Antenna must use a unique type of connector to attach to the EUT.

Unit must be professionally installed, and installer shall be responsible for verifying that the correct antenna is employed with the unit.

And according to FCC 47 CFR section 15.247 (b), if the transmitting antennas of directional gain greater than 6dBi are used, the power shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

Antenna Connector Construction

The EUT has one internal antenna, which was permanently attached, and the maximum antenna gain is 2.0dBi, fulfill the requirement of this section. Please refer to the EUT photos.

Result: Compliance.

Report No.: SZNS220901-39736E-RF-00B

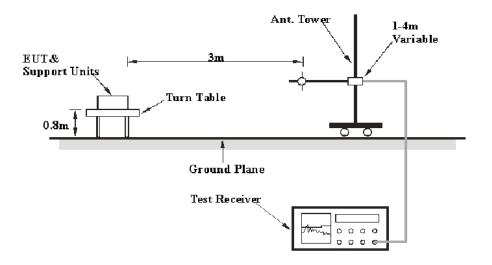

FCC §15.209, §15.205 & §15.247(d) - SPURIOUS EMISSIONS

Applicable Standard

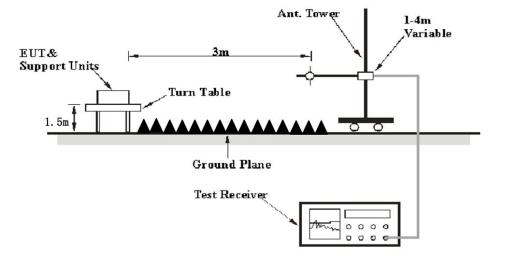

FCC §15.247 (d); §15.209; §15.205;

EUT Setup

Below 1 GHz:

Above 1GHz:

The radiated emission tests were performed in the 3 meters test site, using the setup accordance with the ANSI C63.10-2013. The specification used was the FCC 15.209, and FCC 15.247 limits.

EMI Test Receiver & Spectrum Analyzer Setup

The system was investigated from 30 MHz to 10GHz.

During the radiated emission test, the EMI test receiver & Spectrum Analyzer Setup were set with the following configurations:

Report No.: SZNS220901-39736E-RF-00B

| Frequency Range | RBW | Video B/W | IF B/W | Measurement |
|-------------------|---------|--------------|---------|-------------|
| 30 MHz – 1000 MHz | 100 kHz | 300 kHz | 120 kHz | QP |
| | 1MHz | 3 MHz | / | PK |
| Above 1 GHz | 1MHz | 10 Hz Note 1 | / | Average |
| | 1MHz | >1/T Note 2 | / | Average |

Note 1: when duty cycle is no less than 98% Note 2: when duty cycle is less than 98%

Test Procedure

Maximizing procedure was performed on the highest emissions to ensure that the EUT complied with all installation combinations.

Data was recorded in Quasi-peak detection mode for frequency range of 30 MHz-1 GHz, peak and Average detection modes for frequencies above 1 GHz.

Corrected Factor & Margin Calculation

The Corrected Factor is calculated by adding the Antenna Factor and Cable Loss, and subtracting the Amplifier Gain. The basic equation is as follows:

Corrected Factor = Antenna Factor + Cable Loss - Amplifier Gain

The "Over Limit or Margin" column of the following data tables indicates the degree of compliance with the applicable limit. For example, a over limit/margin of -7dB means the emission is 7dB below the limit. The equation for margin calculation is as follows:

Over Limit/Margin = Level/Corrected Amplitude – Limit Level/Corrected Amplitude= Read Level + Corrected Factor

Test Data

Environmental Conditions

| Temperature: | 25~27.2°C |
|--------------------|-----------|
| Relative Humidity: | 54~60% |
| ATM Pressure: | 101.0 kPa |

The testing was performed by Level Li on 2022-09-23 for below 1G and on 2022-09-11 for above 1G.

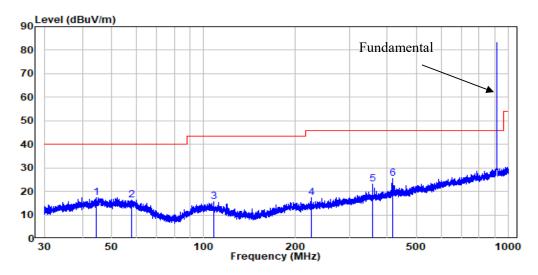

EUT operation mode: Transmitting (Pre-scan in the X,Y and Z axes of orientation, the worst case of orientation was recorded)

30MHz - 1GHz: (worst case is Middle channel)

Note: When the test result of peak was less than the limit of QP more than 6dB, just peak value were recorded.

Report No.: SZNS220901-39736E-RF-00B

Note:

 $Corrected\ Factor = Antenna\ factor\ (RX) + Cable\ Loss - Amplifier\ Factor$

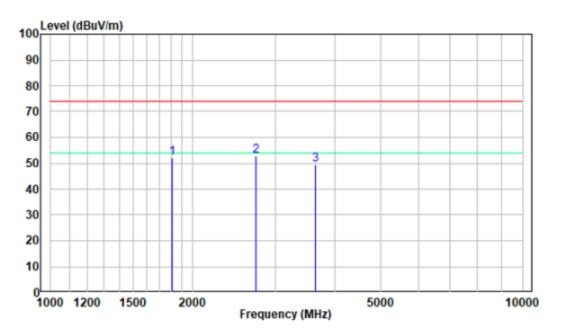

Corrected Amplitude = Corrected Factor + Reading

Margin = Corrected. Amplitude - Limit
The other spurious emission which is in the noise floor level was not recorded.

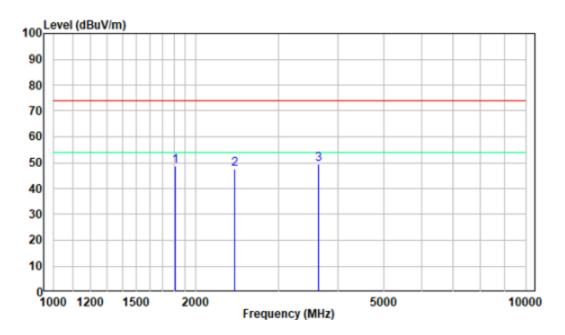

When the test result of peak was less than the limit of average, just peak value were recorded.

FCC $\S15.247(a)$ (2) – 6 dB EMISSION BANDWIDTH

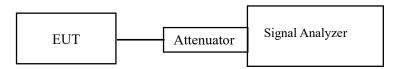

Applicable Standard

Systems using digital modulation techniques may operate in the 902–928 MHz, 2400–2483.5 MHz, and 5725–5850 MHz bands. The minimum 6 dB bandwidth shall be at least 500 kHz.

Report No.: SZNS220901-39736E-RF-00B

Test Procedure

- 1. Check the calibration of the measuring instrument using either an internal calibrator or a known signal from an external generator.
- 2. Position the EUT without connection to measurement instrument. Turn on the EUT and connect it to measurement instrument. Then set it to any one convenient frequency within its operating range. Set a reference level on the measuring instrument equal to the highest peak value.
- 3. Measure the frequency difference of two frequencies that were attenuated 6 dB from the reference level. Record the frequency difference as the emission bandwidth.
- 4. Repeat above procedures until all frequencies measured were complete.

FCC §15.247(b) (3) - MAXIMUM CONDUCTED OUTPUT POWER

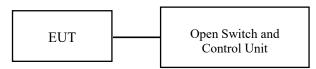

Applicable Standard

According to FCC §15.247(b) (3), for systems using digital modulation in the 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz bands: 1 Watt. As an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the maximum conducted output power. Maximum Conducted Output Power is defined as the total transmit power delivered to all antennas and antenna elements averaged across all symbols in the signaling alphabet when the transmitter is operating at its maximum power control level. Power must be summed across all antennas and antenna elements. The average must not include any time intervals during which the transmitter is off or is transmitting at a reduced power level. If multiple modes of operation are possible (e.g., alternative modulation methods), the maximum conducted output power is the highest total transmit power occurring in any mode.

Report No.: SZNS220901-39736E-RF-00B

Test Procedure

- c. Place the EUT on a bench and set it in transmitting mode.
- d. Remove the antenna from the EUT and then connect a low loss RF cable from the antenna port to one test equipment.
- e. Add a correction factor to the display.

Note: the Open Switch and Control Unit has a built-in power sensor.

FCC §15.247(d) – 100 kHz BANDWIDTH OF FREQUENCY BAND EDGE

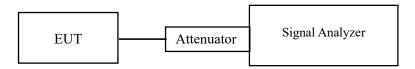

Report No.: SZNS220901-39736E-RF-00B

Applicable Standard

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

Test Procedure

- f. Check the calibration of the measuring instrument using either an internal calibrator or a known signal from an external generator.
- g. Position the EUT without connection to measurement instrument. Turn on the EUT and connect its antenna terminal to measurement instrument via a low loss cable. Then set it to any one measured frequency within its operating range, and make sure the instrument is operated in its linear range.
- h. Set RBW to 100 kHz and VBW of spectrum analyzer to 300 kHz with a convenient frequency span including 100 kHz bandwidth from band edge.
- i. Measure the highest amplitude appearing on spectral display and set it as a reference level. Plot the graph with marking the highest point and edge frequency.
- j. Repeat above procedures until all measured frequencies were complete.

FCC §15.247(e) - POWER SPECTRAL DENSITY

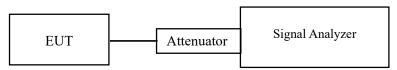

Applicable Standard

For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission. This power spectral density shall be determined in accordance with the provisions of paragraph (b) of this section. The same method of determining the conducted output power shall be used to determine the power spectral density.

Report No.: SZNS220901-39736E-RF-00B

Test Procedure

- k. Use this procedure when the maximum peak conducted output power in the fundamental emission is used to demonstrate compliance.
- 1. Set the RBW to: 3kHz< RBW<100 kHz.
- m. Set the VBW $\geq 3 \times RBW$.
- n. Set the span to 1.5 times the DTS bandwidth.
- o. Detector = peak.
- p. Sweep time = auto couple.
- q. Trace mode = max hold.
- r. Allow trace to fully stabilize.
- s. Use the peak marker function to determine the maximum amplitude level within the RBW.
- t. If measured value exceeds limit, reduce RBW (no less than 3 kHz) and repeat.
