4 Introduction

This paper presents antenna measurements for the *FLIR-E1330* thermal camera. The *FLIR-E1330* camera is equipped with an internal dual band Wi-Fi antenna supporting the 2,4GHz and 5GHz frequency bands.

Figure 4-1 *FLIR-E1330* thermal camera

5 Antenna measurements

The Wi-Fi antenna is verified in terms of *Voltage Standing Wave Ratio* (VSWR), *antenna efficiency* and *radiation patterns*.

5.1 Voltage Standing Wave Ratio

Voltage Standing Wave Ratio (VSWR) is a measure of how well an antenna is impedance matched to the system impedance. A VSWR of one means a perfect match where all the available power is delivered to the antenna and an infinite VSWR means a short or an open circuit where all the energy is reflected.

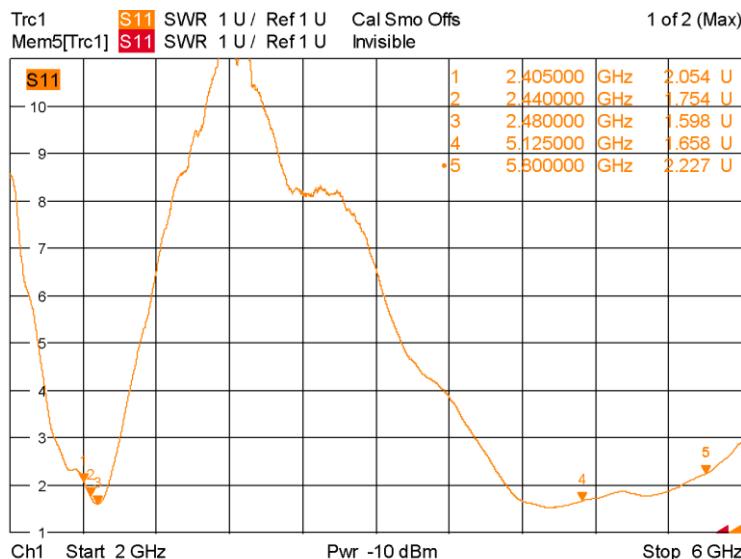

Figure 5-1 VSWR for the FLIR-E1330 Wi-Fi antenna

5.2 Antenna efficiency

The antenna efficiency measurements are carried out in a Satimo SG-23 6 GHz Stargate Antenna Test Chamber. The antenna efficiency, ε_T , is the ratio of the power delivered at the 50Ω antenna interface, P_t , relative to the power radiated from the antenna, $P_{radiated}$.

$$\varepsilon_T = \frac{P_{radiated}}{P_t}$$

The antenna system efficiency can be expressed in dB or %, where 100% corresponds to 0dB.

5.3 Radiation patterns

The antenna radiation pattern measurements are carried out in a Satimo SG-23 6 GHz Stargate Antenna Test Chamber. Radiation patterns are presented for three measurement planes: XY-, XZ- and YZ-planes as well as a 3D pattern visualising the radiation pattern around the DUT.

5.4 Antenna peak gain

The antenna peak gain in each measurement plane for 2,4GHz and 5GHz is summarized in Table 3 and Table 4.

5GHz	7.4	0.0	7.1	7.7

6 Summary

The antenna performance for the *FLIR-E1330* thermal camera has been characterized. Results for antenna VSWR, antenna efficiency and radiation patterns are presented.

Maximum antenna peak gain the frequency bands 2.4 and 5GHz is measured to be:

2.4GHz: 1.9dBi

5GHz: 7.7dBi
