

HCT CO., LTD.

CERTIFICATE OF COMPLIANCE

FCC Certification

Date of Issue:

March 21, 2014

Test Site/Location:

Applicant Name:

LG Electronics MobileComm U.S.A., Inc.

ectionics MobileContin 0.5.A., Inc.

Address:

1000 Sylvan Avenue, Englewood Cliffs NJ 07632

HCT CO., LTD., 74, Seoicheon-ro 578beon-gil, Majang-myeon,

Icheon-si, Gyeonggi-do, Korea

Report No.: HCT-R-1403-F026-1

HCT FRN: 0005866421

FCC ID: ZNFD625

APPLICANT: LG Electronics MobileComm U.S.A., Inc.

FCC Model(s): LG-D625

Additional FCC Model(s):

LGD625, D625

EUT Type:

Cellular/PCS GSM, WCDMA, LTE Phone with Bluetooth/WLAN/NFC

FCC Classification:

Licensed Portable Transmitter Held to Ear (PCE)

FCC Rule Part(s):

§2, §27

Tx Frequency:

 $2502.5\ \text{MHz} - 2567.5\ \text{MHz}$ (LTE - Band 7): $5\ \text{MHz}$

2505.0 MHz - 2565.0 MHz (LTE - Band 7): 10 MHz 2507.5 MHz - 2562.5 MHz (LTE - Band 7): 15 MHz 2510.0 MHz - 2560.0 MHz (LTE - Band 7): 20 MHz

Max. RF Output Power:

Band 7 (5 MHz) :

0.364 W (QPSK) (25.61 dBm) 0.376 W (16-QAM) (25.75 dBm)

0.336 W (QPSK) (25.26 dBm)

Band 7 (10 MHz) :

0.358 W (16-QAM) (25.54 dBm)

Band 7 (15 MHz) : 0.376 W (QPSK) (25.75 dBm)

0.380 W (16-QAM) (25.80 dBm)

Band 7 (20 MHz):

0.394 W (QPSK) (25.96 dBm)

0.451 W (16-QAM) (26.54 dBm)

Emission Designator(s):

Band 7 (5 MHz): 4M50G7D (QPSK) / 4M50W7D (16-QAM)
Band 7 (10 MHz): 8M97G7D (QPSK) / 8M95W7D (16-QAM)
Band 7 (15 MHz): 13M4G7D (QPSK) / 13M5W7D (16-QAM)
Band 7 (20 MHz): 17M9G7D (QPSK) / 17M9W7D (16-QAM)

 $The \ measurements \ shown \ in \ this \ report \ were \ made \ in \ accordance \ with \ the \ procedures \ specified \ in \ \S 2.947. \ I \ assume \ full \ responsibility$

for the accuracy and completeness of these measurements, and for the qualifications of all persons taking them.

HCT CO., LTD. Certifies that no party to this application has subject to a denial of Federal benefits that includes FCC benefits pursuant to section 5301 of the Anti-Drug Abuse Act of 1998,21 U.S. C.853(a)

Report prepared by : Jong Seok Lee

Test engineer of RF Team

Approved by : Chang Seok Choi Manager of RF Team

MEASUREMENT REPORT

1. GENERAL INFORMATION

Applicant Name: LG Electronics MobileComm U.S.A., Inc.

Address: 1000 Sylvan Avenue, Englewood Cliffs NJ 07632

FCC ID: ZNFD625

Application Type: Certification

FCC Classification: Licensed Portable Transmitter Held to Ear (PCE)

FCC Rule Part(s): §2, §27

EUT Type: Cellular/PCS GSM, WCDMA, LTE Phone with Bluetooth/WLAN/NFC

FCC Model(s): LG-D625

Additional FCC Model(s): LGD625, D625

Tx Frequency: 2502.5 MHz – 2567.5 MHz (LTE – Band 7): 5 MHz

 $2505.0~\mathrm{MHz} - 2565.0~\mathrm{MHz}$ (LTE - Band 7): 10 MHz $2507.5~\mathrm{MHz} - 2562.5~\mathrm{MHz}$ (LTE - Band 7): 15 MHz $2510.0~\mathrm{MHz} - 2560.0~\mathrm{MHz}$ (LTE - Band 7): 20 MHz

Max. RF Output Power: Band 7 (5 MHz): 0.364 W (QPSK) (25.61 dBm)

0.376 W (16-QAM) (25.75 dBm)

Band 7 (10 MHz): 0.336 W (QPSK) (25.26 dBm) 0.358 W (16-QAM) (25.54 dBm)

Band 7 (15 MHz): 0.376 W (QPSK) (25.75 dBm)

0.380 W (16-QAM) (25.80 dBm)

Band 7 (20 MHz): 0.394 W (QPSK) (25.96 dBm)

0.451 W (16-QAM) (26.54 dBm)

Emission Designator(s): Band 7 (5 MHz): 4M50G7D (QPSK) / 4M50W7D (16-QAM)

Band 7 (10 MHz): 8M97G7D (QPSK) / 8M95W7D (16-QAM)

Band 7 (15 MHz): 13M4G7D (QPSK) / 13M5W7D (16-QAM)

Band 7 (20 MHz): 17M9G7D (QPSK) / 17M9W7D (16-QAM)

Date(s) of Tests: February 15, 2014 ~ March 13, 2014

Antenna Specification Manufacturer: acetechnologyA

Antenna type: Internal antenna
Peak Gain: LTE Band7: -3.7 dBi

2. INTRODUCTION

2.1. EUT DESCRIPTION

The LG Electronics MobileComm U.S.A., Inc. LG-D625 Cellular/PCS GSM, WCDMA, LTE(Band 4, 7) Phone with Bluetooth/WLAN/NFC consists of GPRS Class12, EDGE 12, GSM850, GSM1900, WCDMA850, WCDMA1900, HSDPA, HSUPA and DC-HSDPA.

2.2. MEASURING INSTRUMENT CALIBRATION

The measuring equipment, which was utilized in performing the tests documented herein, has been calibrated in accordance with the manufacturer's recommendations for utilizing calibration equipment, which is traceable to recognized national standards.

2.3. TEST FACILITY

The Fully-anechoic and conducted measurement facility used to collect the radiated data are located at the 74, Seoicheon-ro 578beon-gil, Majang-myeon, Icheon-si, Gyeonggi-do, Korea.

3. DESCRIPTION OF TESTS

3.1 ERP/EIRP RADIATED POWER AND RADIATED SPURIOUS EMISSIONS

ERP/EIRP

Note: ERP(Effective Radiated Power), EIRP(Equivalent Isotropic Radiated Power)

Test Procedure

Radiated emission measurements are performed in the Fully-anechoic chamber. The equipment under test is placed on a non-conductive table 3-meters away from the receive antenna in accordance with ANSI/TIA-603-C-2004 Clasue 2.2.17. The turntable is rotated through 360 degrees, and the receiving antenna scans in order to determine the level of the maximized emission. The level and postion of the maximized emission is recorded with the spectrum analyzer using a positive peak detector.

A half wave dipole is then substituted in place of the EUT. For emissions above 1GHz, a horn antenna is substituted in place of the EUT. The substitute antenna is driven by a signal generator and the previously recorded signal was duplicated.

The power is caculated by the following formula;

 $P_{d(dBm)} = Pg_{(dBm)} - cable loss_{(dB)} + antenna gain_{(dB)}$

Where: P_d is the dipole equivalent power and P_g is the generator output power into the substitution antenna.

The maximum EIRP is calculated by adding the forward power to the calibrated source plus its appropriate gain value. These steps are repeated with the receiving antenna in both vertical and horizontal polarization. the difference between the gain of the horn and an isotropic antenna are taken into consideration

Radiated spurious emissions

1. Frequency Range: 30 MHz ~ 10th Harmonics of highest channel fundamental frequency.

2. Measured distance: 30 MHz ~ 11 GHz at 3 m

11 GHz ~ 26 GHz at 1m

3. The EUT was setup to maximum output power. The 100 kHz RBW was used to scan from 30 MHz to 1 GHz. Also, the 1 MHz RBW was used to scan from 1 GHz to 26.5 GHz. And limit is -25 dBm. The high, low and a middle channel were tested for out of band measurements.

Page 6of 55

3.2 OCCUPIED BANDWIDTH.

Test set-up

(Configuration of conducted Emission measurement)

Test Procedure

OBW is tested in accordance with KDB971168 D01 Power Meas License Digital Systems v02r01, June 7, 2013, Section 4.2

The EUT was setup to maximum output power at its lowest channel. The occupied bandwidth was measured using a spectrum analyzer. The measurements are repeated for the highest and a middle channel. The EUT's occupied bandwidth is measured as the width of the signal between two points, one below the carrier center frequency and one above the carrier frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power. Plots of the EUT's occupied bandwidth are shown herein.

Page 7of 55

3.3 SPURIOUS AND HARMONIC EMISSIONS AT ANTENNA TERMINAL.

Test Procedure

Spurious and harmonic emissions at antenna terminal is tested in accordance with KDB971168 D01 Power Meas License Digital Systems v02r01, June 7, 2013, Section 6.0.

The level of the carrier and the various conducted spurious and harmonic frequencies is measured by means of a calibrated spectrum analyzer.

The EUT was setup to maximum output power. The 1 MHz RBW was used to scan from 30 MHz to 26.5 GHz. And limit is -25 dBm. The high, low and a middle channel were tested for out of band measurements.

- Channel Edge Requirement: In the 1MHz bands immediately outside and adjacent to the channel, a resolution bandwidth of at least 1 percent of the emission bandwidth of the fundamental emission of the transmitter may be employed to measure the out of band Emissions. Limit is -13dBm at channel edge and -25dBm at up to 5.5MHz from the channel edge.

NOTES: The analyzer plot offsets were determined by below conditions.

• For LTE Band 7, total offset 28.3 dBm = 20 dBm attenuator + 6 dBm Divider + 2.3 dBm RF cables.

Page 8of 55

3.4 PEAK-AVERAGE RATIO.

Test Procedure

Peak to Average Power Ratio is tested in accordance with KDB971168 D01 Power Meas License Digital Systems v02r01, June 7, 2013, Section 5.7.

- Section 5.7.1 CCDF Procedure

- a) Set resolution/measurement bandwidth ≥ signal's occupied bandwidth;
- b) Set the number of counts to a value that stabilizes the measured CCDF curve;
- c) Set the measurement interval as follows:
 - 1) for continuous transmissions, set to 1 ms,
 - 2) for burst transmissions, employ an external trigger that is synchronized with the EUT burst timing sequence, or use the internal burst trigger with a trigger level that allows the burst to stabilize and set the measurement interval to a time that is less than or equal to the burst duration.
- d) Record the maximum PAPR level associated with a probability of 0.1%.

- Section 5.7.2 Alternate Procedure

Use one of the procedures presented in 5.1 to measure the total peak power and record as P_{Pk} . Use one of the applicable procedures presented 5.2 to measure the total average power and record as P_{Avg} . Determine the P.A.R. from: P.A.R_(dB) = $P_{Pk (dBm)} - P_{Avg (dBm)}$ (P_{Avg} = Average Power + Duty cycle Factor)

5.1.1 Peak power measurements with a spectrum/signal analyzer or EMI receiver

The following procedure can be used to determine the total peak output power.

- a) Set the RBW ≥ OBW.
- b) Set VBW ≥ 3 × RBW.
- c) Set span ≥ 2 x RBW
- d) Sweep time = auto couple.
- e) Detector = peak.
- f) Ensure that the number of measurement points ≥ span/RBW.
- g) Trace mode = max hold.
- h) Allow trace to fully stabilize.
- i) Use the peak marker function to determine the peak amplitude level.

Page 9of 55

5.2.2 Procedures for use with a spectrum/signal analyzer when EUT cannot be configured to transmit continuously and sweep triggering/signal gating cannot be properly implemented

If the EUT cannot be configured to transmit continuously (burst duty cycle < 98%), then one of the following procedures can be used. The selection of the applicable procedure will depend on the characteristics of the measured burst duty cycle.

Measure the burst duty cycle with a spectrum/signal analyzer or EMC receiver can be used in zero-span mode if the response time and spacing between bins on the sweep are sufficient to permit accurate measurement of the burst on/off time of the transmitted signal.

5.2.2.2 Constant burst duty cycle

If the measured burst duty cycle is constant (i.e., duty cycle variations are less than ± 2 percent), then:

- a) Set span to at least 1.5 times the OBW.
- b) Set RBW = 1-5% of the OBW, not to exceed 1 MHz.
- c) Set VBW ≥ 3 x RBW.
- d) Number of points in sweep ≥ 2 × span / RBW. (This gives bin-to-bin spacing ≤ RBW/2, so that narrowband signals are not lost between frequency bins.)
- e) Sweep time = auto.
- f) Detector = RMS (power averaging).
- g) Set sweep trigger to "free run".
- h) Trace average at least 100 traces in power averaging (i.e., RMS) mode.
- i) Compute power by integrating the spectrum across the OBW of the signal using the instrument's band power measurement function with band limits set equal to the OBW band edges. If the instrument does not have a band power function, sum the spectrum levels (in power units) at intervals equal to the RBW extending across the entire OBW of the spectrum.
- j) Add 10 log (1/x), where x is the duty cycle, to the measured power in order to compute the average power during the actual transmission times (because the measurement represents an average over both the on and off times of the transmission).

 For example, add 10 log (1/0.25) = 6 dB if the duty cycle is a constant 25%.

Page 10of 55

3.5 FREQUENCY STABILITY / VARIATION OF AMBIENT TEMPERATURE

Test Set-up

* Nominal Operating Voltage

Test Procedure

Frequency stability is tested in accordance with ANSI/TIA-603-C-2004 section 2.2.2.

The frequency stability of the transmitter is measured by:

- a.) Temperature: The temperature is varied from 30 °C to + 50 °C using an environmental chamber.
- b.) Primary Supply Voltage: The primary supply voltage is varied from battery end point to 115 % of the voltage normally at the input to the device or at the power supply terminals if cables are not normally supplied.

Specification — the frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block. The frequency stability of the transmitter shall be maintained within ± 0.000 25 %(± 2.5 ppm) of the center frequency.

Time Period and Procedure:

The carrier frequency of the transmitter is measured at room temperature (20°C to provide a reference).

- 1. The equipment is turned on in a "standby" condition for one minute before applying power to the transmitter. Measurement of the carrier frequency of the transmitter is made within one minute after applying power to the transmitter.
- 2. Frequency measurements are made at 10°C intervals ranging from -30°C to +50°C. A period of at least one halfhour is provided to allow stabilization of the equipment at each temperature level.

6. SAMPLE CALCULATION

A. EIRP Sample Calculation

Mada	Ch./ Freq.		Measured	Substitude	Ant. Gain	C.I. Bal		EII	RP
Mode	channel	Freq.(MHz)	Level(dBm)	LEVEL(dBm)	(dBi)	C.L	Pol.	w	dBm
LTE	21100	2,535.00	-15.36	19.46	10.72	1.78	V	0.69	28.40
Band7	21100	2,000.00	-10.00	13.40	10.72	1.70	V	0.09	20.40

EIRP = SubstitudeLEVEL(dBm) + Ant. Gain - CL(Cable Loss)

- 1) The EUT mounted on a wooden tripod is 0.8 meter above test site ground level.
- 2) During the test, the turn table is rotated until the maximum signal is found.
- 3) Record the field strength meter's level.
- 4) Replace the EUT with dipole/Horn antenna that is connected to a calibrated signal generator.
- 5) Increase the signal generator output till the field strength meter's level is equal to the item (3).
- 6) The signal generator output level with Ant. Gain and cable loss are the rating of Equivalent Isotropic Radiated Power (**EIRP**).

NOTES:

Effective Radiated Power Output Measurements by Substitution Method according to ANSI/TIA/EIA-603-C-2004, Aug. 17, 2004:

The EUT was placed on a non-conductive styrofoam resin table 3-meters from the receive antenna. The receive antenna height and turntable rotation was adjusted for the highest reading on the receive spectrum analyzer. For 5 MHz, 10MHz BW signals, a peak detector is used, with RBW \geq OBW, VBW \geq 3 x RBW. A Horn antenna was substituted in place of the EUT. This dipole antenna was driven by a signal generator and the level of the signal generator was adjusted to obtain the same receive spectrum analyzer reading. The conducted power at the terminals of the Horn antenna is measured. The difference between the gain of the horn and an isotropic antenna is taken into consideration and the EIRP is recorded.

Also, we have done x, y, z planes in EUT and horizontal and vertical polarization in detecting antenna. The worst case of the EUT is x plane in LTE mode. Also worst case of detecting Antenna is horizontal polarization in LTE mode.

NOTES: 1. Radiated Spurious Emission Measurements at 1 meter and 3 meter by Substitution Method according to ANSI/TIA/EIA-603-C-2004, Aug. 17, 2004:

- 2. We are performed all frequency to 10th harmonics from 30 MHz. Measurements above show only up to 3 maximum emissions noted, or would be lesser if no specific emissions from the EUT are recorded (ie: margin > 20 dB from the applicable limit) and considered that's already beyond the background noise floor.
- 3. we have done x, y, z planes in EUT and horizontal and vertical polarization in detecting antenna.
- 4. Worst case is 1 resource block.
