ANNEX I Sensor Triggering Data Summary

SAR sensor	
Frequency	Conducted power reduced
LTE Band 7	1dBm
Trigger distance	
Front	2mm
Back	2mm
Bottom	2mm

According to the above description, this device was tested by the manufacturer to determine the SAR sensor triggering distances for the rear and bottom edge of the device. The measured power state within $\pm 5\text{mm}$ of the triggering points (or until touching the phantom) is included for rear and each applicable edge.

To ensure all production units are compliant it is necessary to test SAR at a distance 1mm less than the smallest distance from the device and SAR phantom with the device at maximum output power without power reduction.

We tested the power and got the different proximity sensor triggering distances for front, rear and bottom edge. But the manufacturer has declared 2mm is the most conservative triggering distance for main antenna. So base on the most conservative triggering distance of 2mm, additional SAR measurements were required at 1mm from the highest SAR position.

Front

Moving device toward the phantom:

The power state								
Distance [mm]	7	6	5	4	3	2	1	0
Main antenna	Normal	Normal	Normal	Normal	Normal	Low	Low	Low

Moving device away from the phantom:

The power state								
Distance [mm]	0	1	2	3	4	5	6	7
Main antenna	Low	Low	Normal	Normal	Normal	Normal	Normal	Normal

Rear

Moving device toward the phantom:

The power state								
Distance [mm]	7	6	5	4	3	2	1	0
Main antenna	Normal	Normal	Normal	Normal	Normal	Low	Low	Low

Moving device away from the phantom:

The power state								
Distance [mm]	0	1	2	3	4	5	6	7
Main antenna	Low	Low	Normal	Normal	Normal	Normal	Normal	Normal

Bottom Edge

Moving device toward the phantom:

The power state								
Distance [mm]	7	6	5	4	3	2	1	0
Main antenna	Normal	Normal	Normal	Normal	Normal	Low	Low	Low

Moving device away from the phantom:

The power state								
Distance [mm]	0	1	2	3	4	5	6	7
Main antenna	Low	Low	Normal	Normal	Normal	Normal	Normal	Normal

The influence of table tilt angles to proximity sensor triggering is determined by positioning each edge that contains a transmitting antenna, perpendicular to the flat phantom, at the smallest sensor triggering test distance by rotating the device around the edge next to the phantom in $\leq 10^\circ$ increments until the tablet is $\pm 45^\circ$ or more from the vertical position at 0° .

The Front evaluation for main antenna

The rear evaluation for main antenna

The bottom edge evaluation for main antenna

Based on the above evaluation, we come to the conclusion that the sensor triggering is not released and normal maximum output power is not restored within the $\pm 45^\circ$ range at the smallest sensor triggering test distance declared by manufacturer.
