The EUT utilizes an internal Antenna.

#### 2.0 **General Description**

2.1 Product Description

VERIZON CONNECT, INC. supplied the following description of the EUT:

HID ISO PROXII RFID cards are read and data is transferred to the VTU device via a wiring harness connection using 1WIRE/DS1990 Emulation mode. Operating Freq: 110kHz-125kHz.

| Applicant name & address | VERIZON CONNECT, INC.<br>5055 North Point Parkway<br>Alpharetta, GA 30009 USA |
|--------------------------|---|
| Contact info / Email     | Lawrence Adelberg / Lawrence.adelberg@veriizonconnect.com                     |
| Model                    | PLA-X21   |
| FCC Identifier           | ZOQ-PLAX21  |
| IC Identifier            | 9734A-PLAX21  |
| Operating Frequency      | 110 kHz to 125 kHz  |
| Number of Channels       | 1   |
| Type of Modulation       | ASK   |
| Antenna Type             | Internal Antenna  |

#### **Overview of the EUT**

| EUT receive date:      | September 26, 2022   |
|------------------------|--|
| EUT receive condition: | The EUT was received in good condition with no apparent damage. As |
|                        | declared by the Applicant it is identical to the production units. |
| Test start date:       | September 26, 2022   |
| Test completion date:  | September 28, 2022   |
| *                      |  |

#### 2.2 Related Submittal(s) Grants

None

#### 2.3 Test Methodology

Both AC mains line-conducted and radiated emissions measurements were performed according to the procedures in ANSI C63.4: 2014. Radiated tests were performed at an antenna to EUT distance of 10 meters, unless stated otherwise in this test report. All other measurements were made in accordance with the procedures in part 2 of CFR 47 7, ANSI C63.10: 2013, ANSI C63.4-2014 & RSS-GEN Issue 5.

#### 2.4 Test Facility

The radiated emission test site and conducted measurement facility used to collect the data is 10m semianechoic chamber located in Menlo Park, California. This test facility and site measurement data have been fully placed on file with the FCC and Industry Canada (Site # 2042L-1).

#### 2.5 Measurement Uncertainty

Compliance with the limits was based on the results of the measurements and doesn't take into account the measurement uncertainty.

| Measurement                                    | Expanded Uncertainty (k=2) |                    |           |  |  |  |

## 3.0 System Test Configuration

3.1 EUT Photo

#### 3.2 Block Diagram of Test Setup

The diagram shown below details the interconnection of the EUT and support equipment. For specific layout, refer to the test configuration photograph in the relevant section of this report.

| $\mathbf{S} = $ Shielded | $\mathbf{F} = $ With Ferrite    |
|--------------------------|---------------------------------|
| U = Unshielded           | $\mathbf{m}$ = Length in Meters |

#### 3.3 Justification

For radiated emission measurements the EUT is placed on a non-conductive table. The EUT was configured to continuously transmit. The highest clock frequency used in the EUT was 125 kHz, hence radiated emissions was scanned up to 1 GHz.

3.4 Software Exercise Program

None

3.5 Mode of Operation during test

The Verizon Connect RFID readers was set up to continuously transmitting at 110 kHz.

3.6 Modifications required for Compliance

No modifications were made by the manufacturer to bring the EUT into compliance.

3.7 Additions, deviations and exclusions from standards

No additions, deviations or exclusion have been made from standard.

#### 4.0 Measurement Results

- 4.1 Field Strength of Fundamental and Radiated Emissions Outside the band
- 4.1.1 Requirements
- §15.209 Radiated emission limits; general requirements.

| Frequency (MHz) | Field strength (microvolts/meter) | Measurement distance (meters) |
|-----------------|-----------------------------------|-------------------------------|
| 0.009-0.490     | 2400/F(kHz)                       | 300                           |
| 0.490-1.705     | 24000/F(kHz)                      | 30                            |
| 1.705-30.0      | 30                                | 30                            |

| 88-216          | 150                               | 3                             |
| 216-960         | 200                               | 3                             |
| Above 960       | 500                               | 3                             |

4.1.2 Procedure

#### Radiated Measurements Below 30 MHz

During the test the EUT is rotated and the measuring antenna angles are varied during the search for maximum signal level.

Radiated emissions are taken at ten meters unless the signal level is too low for measurement at that distance. If necessary, a pre-amplifier is used and/or the test is conducted at a closer distance. Measurements for below 30 MHz were made at 10 meters. Data results below are corrected for distance back to 30 meters.

#### Radiated Measurements Above 30 MHz

During the test the EUT is rotated and the measuring antenna height and polarization are varied during the search for maximum signal level. The antenna height is varied from 1 to 4 meters.

Radiated emissions are taken at ten meters unless the signal level is too low for measurement at that distance. If necessary, a pre-amplifier is used and/or the test is conducted at a closer distance. Measurements for above 30 MHz were made at 10 meters.

Radiated emission measurements were performed from 9kHz to 1 GHz. Analyzer resolution is:

200Hz or greater for 9kHz to 150kHz 9 kHz or greater for 150kHz to 30 MHz 120 kHz or greater for 30MHz to 1000 MHz For those frequencies quasi-peak detector applies

Data includes of the worst-case configuration (the configuration which resulted in the highest emission levels). A sample calculation, configuration photographs and data tables of the emissions are included.

#### Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation is as follows:

FS = RA + AF + CF - AG - DCF

Where FS = Field Strength in dB ( $\mu$ V/m)

 $\label{eq:RA} \begin{array}{l} = \mbox{Receiver Amplitude (including preamplifier) in dB (\mu V)} \\ CF = \mbox{Cable Attenuation Factor in dB} \\ AF = \mbox{Antenna Factor in dB (1/m)} \\ AG = \mbox{Amplifier Gain in dB} \\ DCF = \mbox{Distance Correction Factor} \end{array}$ 

Note: FS was measured with loop antenna below 30MHz

#### 4.1.3 Test Result

Note: FS = RA + CorrectionCorrection = AF + CF - Preamp

**Result** Complies by 4.14 dB

#### 4.1.5 Test Configuration Photographs

### The following photographs show the testing configurations used.

#### 4.1.5 Test Configuration Photographs (Continued)

Electromagnetic Radiated Disturbance Setup Photograph

#### 4.2 Occupied Bandwidth FCC 15.215

#### 4.2.1 Requirements

Intentional radiators operating under the alternative provisions to the general emission limits, as contained in §§15.217 through 15.257, must be designed to ensure that the 20 dB bandwidth of the emission, or whatever bandwidth may otherwise be specified in the specific rule section under which the equipment operates, is contained within the frequency band designated in the rule section under which the equipment is operated. The requirement to contain the designated bandwidth of the emission within the specified frequency band includes the effects from frequency sweeping, frequency hopping and other modulation techniques that may be employed as well as the frequency stability of the transmitter over expected variations in temperature and supply voltage.

#### 4.2.2 Procedure

The EUT was setup to transmit in normal operating condition.

Measurements were made with the loop antenna in close proximity of the EUT. Following the procedures of ANSI 63.10: 2013, the 20dB bandwidth measurements were taken. The following plots show Occupied Bandwidth.

#### 4.2.3 Test Results

| Frequency | -20 dB Channel Bandwidth | 99% Channel Bandwidth |
|-----------|--------------------------|-----------------------|

#### 4.3 AC Line Conducted Emission FCC Rule 15.207, FCC 15.107

#### 4.3.1 Requirement

| <b>Frequency Band</b> | Class B Lim | nit dB(µV) | Class A Limit dB(µV) |         |  |
|-----------------------|-------------|------------|----------------------|---------|--|
| MHz                   | Quasi-Peak  | Average    | Quasi-Peak           | Average |  |
| 0.15-0.50             | 66 to 56 *  | 56 to 46 * | 79                   | 66      |  |
| 0.50-5.00             | 56          | 46         | 73                   | 60      |  |
| 5.00-30.00            | 60          | 50         | 73                   | 60      |  |

Note: \*Decreases linearly with the logarithm of the frequency. At the transition frequency the lower limit applies.

#### 4.3.2 Procedure

Measurements are carried out using quasi-peak and average detector receivers in accordance with CISPR 16. An AMN is required to provide a defined impedance at high frequencies across the power feed at the point of measurement of terminal voltage and also to provide isolation of the circuit under test from the ambient noise on the power lines. An AMN as defined in CISPR 16 shall be used.

The EUT is located so that the distance between the boundary of the EUT and the closest surface of the AMN is 0.8m.

Where a flexible mains cord is provided by the manufacturer, this shall be 1m long or if in excess of 1m, the excess cable is folded back and forth as far as possible so as to form a bundle not exceeding 0.4m in length.

The EUT is arranged and connected with cables terminated in accordance with the product specification.

Conducted disturbance is measured between the phase lead and the reference ground, and between the neutral lead and the reference ground. Both measured values are reported.

The EUT, where intended for tabletop use, is placed on a table whose top is 0.8m above the ground plane. A vertical, metal reference plane is placed 0.4m from the EUT. The vertical metal reference-plane is at least 2m by 2m. The EUT shall be kept at least 0.8m from any other metal surface or other ground plane not being part of the EUT. The table is constructed of non-conductive materials. Its dimensions are 1m by 1.5m, but may be extended for larger EUT.

Floor standing EUT are placed on a horizontal metal ground plane and isolated from the ground plane by resting on an insulating material. The metal ground plane extends at least 0.5m beyond the boundaries of the EUT and has minimum dimensions of 2m by 2m.

EUT was placed in transmission mode then tested for conducted emissions per 15.207 to ensure the device complies with 15.207. After, the EUT RF was powered off and was measured to show compliance with the 15.107 limits.

#### 4.3.3 Test Result

### <u>15.107 & 15.207</u>

#### AC Line Conducted Emission, 120VAC 60Hz Phase 1

### 4.3.3 Test Result (Continued)

4.3.4 Test Configuration Photographs

# 4.4 Radiated Emissions on Digital Parts FCC Ref: 15.109, ICES 003, RSS Gen

#### 4.4.1 Test Limit

#### Limits for Electromagnetic Radiated Emissions FCC Section 15.109(b), ICES 003\*, RSS GEN

| Frequency | Class A at 10m | Class B at 3m |
|-----------|----------------|---------------|
| (MHz)     | dB(µV/m)       | dB(µV/m)      |
| 30-88     | 39             | 40.0          |
| 88-216    | 43.5           | 43.5          |
| 216-960   | 46.4           | 46.0          |
| Above 960 | 49.5           | 54.0          |

\* According to FCC Part 15.109(g) an alternative to the radiated emission limits shown above, digital devices may be shown to comply with the limit of CISPR Pub. 22

#### 4.4.2 Procedures

Radiated measurements were taken. 120 kHz resolution bandwidth was used from 30 MHz - 1 GHz. 1 MHz resolution bandwidth was used for measurements done above 1 GHz. All plots are corrected for cable loss, antenna factor, and preamp.

Radiated emission measurements were performed from 30 MHz to 18000 MHz. The data on the following pages list the significant emission frequencies, the limit and the margin of compliance.

Measurements recorded in this section were made with the Transmitter in Tx mode.
