Uni⊛nTrust

1.6 TEST LOCATION

Shenzhen UnionTrust Quality and Technology Co., Ltd.

Address: 16/F, Block A, Building 6, Baoneng Science and Technology Park, Qingxiang Road No.1, Longhua New District, Shenzhen, China 518109 Telephone: +86 (0) 755 2823 0888 Fax: +86 (0) 755 2823 0886

1.7 TEST FACILITY

The test facility is recognized, certified, or accredited by the following organizations:

CNAS-Lab Code: L9069

The measuring equipment utilized to perform the tests documented in this report has been calibrated once a year or in accordance with the manufacturer's recommendations, and is traceable under the ISO/IEC/EN 17025 to international or national standards. Equipment has been calibrated by accredited calibration laboratories.

IC-Registration No.: 21600-1

The 3m Semi-anechoic chamber of Shenzhen UnionTrust Quality and Technology Co., Ltd. has been registered by Certification and Engineering Bureau of Industry Canada for radio equipment testing with Registration No.: 21600-1.

A2LA-Lab Certificate No.: 4312.01

Shenzhen UnionTrust Quality and Technology Co., Ltd. has been accredited by A2LA for technical competence in the field of electrical testing, and proved to be in compliance with ISO/IEC 17025: 2005 General Requirements for the Competence of Testing and Calibration Laboratories and any additional program requirements in the identified field of testing.

FCC Accredited Lab.

Designation Number: CN1194 Test Firm Registration Number: 259480

1.8 DEVIATION FROM STANDARDS

None.

1.9 ABNORMALITIES FROM STANDARD CONDITIONS

None.

1.10OTHER INFORMATION REQUESTED BY THE CUSTOMER

None.

1.11 MEASUREMENT UNCERTAINTY

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the Product as specified in CISPR 16-4-2. This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of k=2.

| No. | Item | Measurement Uncertainty | | |
|-----|---------------------------------|-------------------------|--|--|
| 1 | Conducted emission 9KHz-150KHz | ±3.8 dB | | |
| 2 | Conducted emission 150KHz-30MHz | ±3.4 dB | | |
| 3 | Radiated emission 9KHz-30MHz | ±4.9 dB | | |
| 4 | Radiated emission 30MHz-1GHz | ±4.7 dB | | |
| 5 | Radiated emission 1GHz-18GHz | ±5.1 dB | | |
| 6 | Radiated emission 18GHz-26GHz | ±5.2 dB | | |
| 7 | Radiated emission 26GHz-40GHz | ±5.2 dB | | |

4.5 TEST SETUP

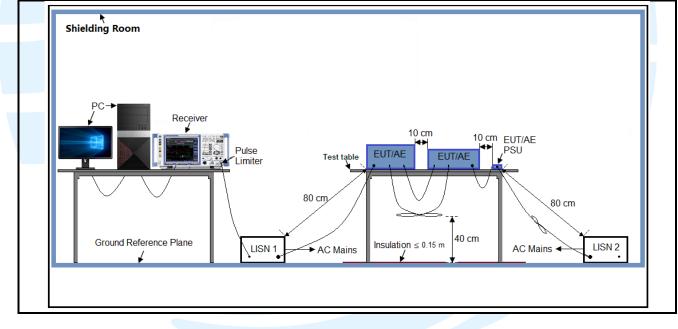

4.5.1 For Radiated Emissions test setup

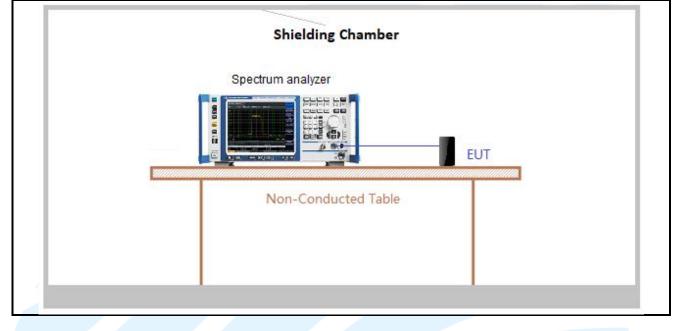

4.5.2 For Conducted Emissions test setup

4.5.3 For Conducted RF test setup

4.6 SYSTEM TEST CONFIGURATION

For emissions testing, the equipment under test (EUT) setup to transmit continuously to simplify the measurement methodology. Care was taken to ensure proper power supply voltages during testing. During testing, radiated emission were performed with the EUT set to transmit at the channel with highest output power as worst-case scenario. It was powered by a 3.7Vdc rechargeable Li-on battery. Only the worst case data were recorded in this test report.

The signal is maximized through rotation and placement in the three orthogonal axes. The antenna height and polarization are varied during the search for maximum signal level. The antenna height is varied from 1 to 4 meters. Radiated emissions are taken at three meters unless the signal level is too low for measurement at that distance. If necessary, a pre-amplifier is used and/or the test is conducted at a closer distance. Therefore, all final radiated testing was performed with the EUT in orientation.

All readings are extrapolated back to the equivalent three meter reading using inverse scaling with distance. Analyzer resolution is 100 kHz or greater for frequencies below 1000 MHz. The resolution is 1 MHz or greater for frequencies above 1000 MHz. The spurious emissions more than 20 dB below the permissible value are not reported.

Radiated emission measurement were performed from the lowest radio frequency signal generated in the device which is greater than 9 kHz to the tenth harmonic of the highest fundamental frequency or to 40 GHz, whichever is lower.

4.7 DUTY CYCLE

Test Procedure: ANSI C63.10-2013 Clause 11.6. Test Results

| Type of Modulation | Packets | On Time (msec) | Period (msec) | Duty Cycle (linear) | Duty Cycle (%) | Duty Cycle Factor (dB) | 1/ T Minimum VBW (kHz) | Average Factor (dB) |
|-----------------------|---------|-------------------|------------------|------------------------|-------------------|---------------------------|------------------------------|------------------------|
| GFSK | 3DH5 | 2.88 | 3.74 | 0.77 | 77.11 | 1.13 | 0.35 | -2.26 |

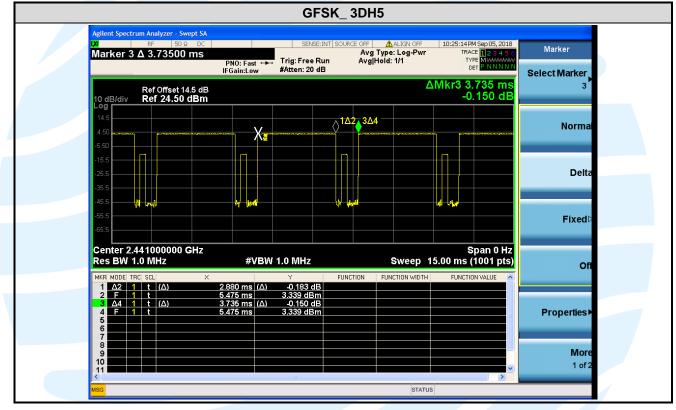

Remark:

1) Duty cycle= On Time/ Period;

2) Duty Cycle factor = 10 * log(1/ Duty cycle);

3) Average factor = $20 \log_{10}$ Duty Cycle.

The test plot as follows

5. RADIO TECHNICAL REQUIREMENTS SPECIFICATION 5.1 REFERENCE DOCUMENTS FOR TESTING

| No. | Identity | Document Title | | | | |
|-----|--------------------|---|--|--|--|--|
| 1 | FCC 47 CFR Part 2 | Frequency allocations and radio treaty matters; general rules and regulations | | | | |
| 2 | FCC 47 CFR Part 15 | Radio Frequency Devices | | | | |
| 3 | ANSI C63.10-2013 | American National Standard for Testing Unlicesed Wireless Devices | | | | |

5.2 ANTENNA REQUIREMENT

Standard Requirement

15.203 requirement:

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator, the manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited.

15.247(b) (4) requirement:

The conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6 dBi. Except as shown in paragraph (c) of this section, if transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced below the stated values in paragraphs (b)(1), (b)(2), and (b)(3) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

EUT Antenna:

Antenna in the interior of the equipment and no consideration of replacement. The gain of the antenna is 0.5 dBi.

Page 17 of 48

5.3 CONDUCTED PEAK OUTPUT POWER

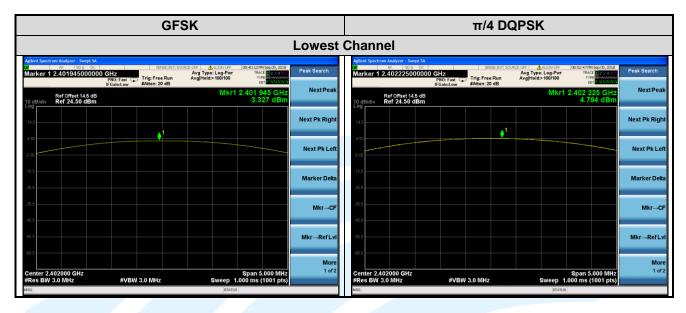

| Test Requirement: | FCC 47 CFR Part 15 Subpart C Section15.247 (b)(1) |
|----------------------------------|---|
| Test Method: | ANSI C63.10-2013 Section 7.8.5 |
| Limit: | For frequency hopping systems operating in the 2400-2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725-5850 MHz band: 1 watt. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW. |
| Test Procedure: | Remove the antenna from the EUT and then connect a low loss RF cable from the antenna port to the spectrum analyzer. |
| | a) Use the following spectrum analyzer settings: Span: Approximately 5 x 20 dB bandwidth, centered on a hopping channel. RBW > 20 dB bandwidth of the emission being measured. VBW ≥ RBW. Sweep: Auto. Detector function: Peak. Trace: Max hold. |
| | b) Allow trace to stabilize. c) Use the marker-to-peak function to set the marker to the peak of the emission. d) The indicated level is the peak output power, after any corrections for external attenuators and cables. |
| Toot Sotup | e) A plot of the test results and setup description shall be included in the test report. Refer to section 4.5.3 for details. |
| Test Setup: Instruments Used: | |

5.420 DB BANDWIDTH

| Test Requirement: Test Method: Limit: Test Procedure: | FCC 47 CFR Part 15 Subpart C Section 15.247 (a)(1) ANSI C63.10-2013 Section 6.9.2 None; for reporting purposes only. Remove the antenna from the EUT and then connect a low loss RF cable from the antenna port to the spectrum analyzer. Use the following spectrum analyzer settings: |
|--|---|
| | a) Span = approximately 2 to 5 times the OBW, centered on a hopping channel. b) RBW = 1% to 5% of the OBW. c) VBW ≥ 3 x RBW d) Sweep = auto; e) Detector function = peak f) Trace = max hold g) All the trace to stabilize, use the marker-to-peak function to set the marker to the peak of the emission, use the marker-delta function to measure and record the 20dB down bandwidth of the emission. |
| | Note: The cable loss and attenuator loss were offset into measure device as an |

amplitude offset.

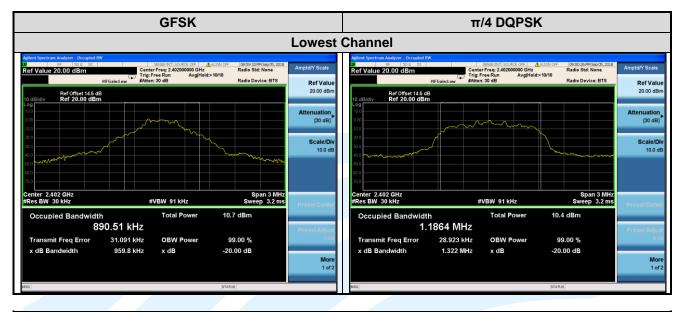

Test Setup: Instruments Used: Test Results:

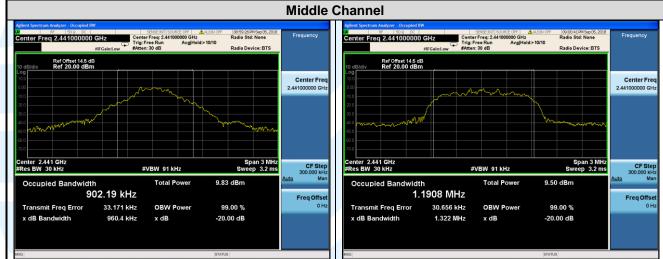

Refer to section 4.5.3 for details. Refer to section 3 for details

5.5CARRIER FREQUENCIES SEPARATION

| Test Requirement: Test Method: Limit: Test Procedure: | FCC 47 CFR Part 15 Subpart C Section 15.247 (a)(1) ANSI C63.10-2013 Section 7.8.2 Frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW. Remove the antenna from the EUT and then connect a low loss RF cable from the antenna port to the spectrum analyzer. Use the following spectrum analyzer settings: |
|--|--|
| | a) Span: Wide enough to capture the peaks of two adjacent channels. b) RBW: Start with the RBW set to approximately 30% of the channel spacing; adjust as necessary to best identify the center of each individual channel. c) Video (or average) bandwidth (VBW) ≥ RBW. d) Sweep: Auto. e) Detector function: Peak. f) Trace: Max hold. g) Allow the trace to stabilize. h) Use the marker-delta function to determine the separation between the peaks of the adjacent channels. |
| | Note: The cable loss and attenuator loss were offset into measure device as an amplitude offset. |
| Test Setup: | Refer to section 4.5.3 for details. |
| Instruments Used: | Refer to section 3 for details |
