## **Laboratory Introduction**

SIEMIC, headquartered in the heart of Silicon Valley, with superior facilities in US and Asia, is one of the leading independent testing and certification facilities providing customers with one-stop shop services for Compliance Testing and Global Certifications.

In addition to <u>testing</u> and <u>certification</u>, SIEMIC provides initial design reviews and <u>compliance</u> <u>management</u> through out a project. Our extensive experience with <u>China</u>, <u>Asia Pacific</u>, <u>North</u> <u>America</u>, <u>European</u>, <u>and international</u> compliance requirements, assures the fastest, most cost effective way to attain regulatory compliance for the <u>global markets</u>.

<b>Country/Region</b>	Accreditation Body	Scope
USA	FCC, A2LA	EMC, RF/Wireless, Telecom
Canada	IC, A2LA, NIST	EMC, RF/Wireless, Telecom
Taiwan	BSMI , NCC , NIST	EMC, RF, Telecom, Safety
Hong Kong	OFTA , NIST	RF/Wireless ,Telecom
Australia	NATA, NIST	EMC, RF, Telecom, Safety
Korea	KCC/RRA, NIST	EMI, EMS, RF, Telecom, Safety
Japan	VCCI, JATE, TELEC, RFT	EMI, RF/Wireless, Telecom
Mexico	NOM, COFETEL, Caniety	Safety, EMC, RF/Wireless, Telecom
Europe	A2LA, NIST	EMC, RF, Telecom , Safety

#### **Accreditations for Conformity Assessment**

#### **Accreditations for Product Certifications**

## 1. EXECUTIVE SUMMARY & EUT INFORMATION

The purpose of this test programmed was to demonstrate compliance of the b mobile HK LimitedMobile phone and model: LQ310 against the current Stipulated Standards. The Mobile phone has demonstrated compliance with the FCC Part 22(H) & FCC Part 24(E): 2011.

	EUT Information	
EUT Description	: Mobile phone	
Main Model	: LQ310	
Serial Model	QS302 : (The difference between Main model and Serial model please refer to the DECLARATION OF SIMILARITY provided by applicant.)	<b>b</b>
Antenna Gain	GSM850: -2.0 dBi : PCS1900: -1.0 dBi Bluetooth: -2.2 dBi	
Input Power	Li-ion Rechargeable Battery b mobile Restrictive Voltage: 4.2V Charging Voltage: 3.7V 800mAh 2.96Wh : AC ADAPTER Model: AXK3550A-09 INPUT: 100-240 V 200 mA 50-60Hz OUTPUT: 5 V DC 500 mA	
Maximum Conducted Peak Power to Antenna	GSM850: 33.15 dBm : PCS1900: 29.52 dBm	
Maximum Radiated ERP/EIRP	GSM850: 27.59 dBm / ERP PCS1900: 27.14 dBm / EIRP	
Classification Per Stipulated Test Standard	: FCC Part 22(H) & FCC Part 24(E): 2011	

Report No: 12050036-FCC-R1 Issue Date: 4th July, 2012 Page: 6 of 37 www.siemic.com.cn

## 5. <u>MEASUREMENTS, EXAMINATION AND DERIVED</u> <u>RESULTS</u>

## 5.1 §1.1307, §2.1093- RF Exposure (SAR)

**Test Result: Pass** 

The EUT is a portable device, thus requires SAR evaluation; please refer to SIEMIC SAR Report: 12050036-H

FCC Part 22(H) & FCC Part 24(E): 2011

Report No: 12050036-FCC-R1 Issue Date: 4th July, 2012 Page: 10 of 37 www.siemic.com.cn

## 5.2 §2.1046 ; §22.913 (a); §24.232 (c)- RF Output Power

1.	Conducted Measurement		
	EUT was set for low, mid, high c	hannel with modulated mode and hig	hest RF output power.
	The spectrum analyzer was conne	ected to the antenna terminal.	
2.	Conducted Emissions Measureme	ent Uncertainty	
	All test measurements carried out	are traceable to national standards.	The uncertainty of the measurement at
	a confidence level of approximate	ely 95% (in the case where distributio	ns are normal), with a coverage factor
	of 2, in the range 30MHz – 40GH	Iz is $\pm 1.5$ dB.	-
3.	Environmental Conditions	Temperature	23°C
		Relative Humidity	50%
		Atmospheric Pressure	1019mbar
4.	Test date: 16th May, 2012		
	Tested By: Back Huang		

#### **Procedures:**

#### For Conducted Power:

Title:

- 1. The transmitter output port was connected to base station.
- 2. Set EUT at maximum power through base station.
- 3. Select lowest, middle, and highest channels for each band and different test mode.

#### For ERP/EIRP:

- The transmitter was placed on a wooden turntable, and it was transmitting into a non-radiating load which was also 1. placed on the turntable.
- 2. The measurement antenna was placed at a distance of 3 meters from the EUT. During the tests, the antenna height and polarization as well as EUT azimuth were varied in order to identify the maximum level of emissions from the EUT. The test was performed by placing the EUT on 3-orthogonal axis.
- The frequency range up to tenth harmonic of the fundamental frequency was investigated. 3.
- Remove the EUT and replace it with substitution antenna. A signal generator was connected to the substitution 4. antenna by a non-radiating cable. The absolute levels of the spurious emissions were measured by the substitution.

Spurious emissions in dB = 10 lg (TXpwr in Watts/0.001) – the absolute level

Spurious attenuation limit in  $dB = 43 + 10 \text{ Log}_{10}$  (power out in Watts)

#### **Test Result: Pass**

**Remark:** Conducted Burst Average power for reporting purposes only

#### **Conducted Power**

	Burst Average Power (dBm)							
Band		G	SM850			G	SM1900	
Channel	128	190	251	Tune up Power tolerant	512	661	810	Tune up Power tolerant
Frequency (MHz)	824.2	836.6	848.8	/	1850.2	1880	1909.8	/

## 5.3 §2.1047 - Modulation Characteristic

According to FCC §2.1047(d), Part 22H & 24E there is no specific requirement for digital modulation, therefore modulation characteristic is not presented.

Report No: 12050036-FCC-R1 Issue Date: 4th July, 2012 13 of 37 Page: www.siemic.com.cn

## 5.4 §2.1049, §22.917, §22.905 & §24.238 - Occupied Bandwidth

1.	Conducted Measurement		
	EUT was set for low, mid, high	channel with modulated mode and	highest RF output power.
	The spectrum analyser was conr	nected to the antenna terminal.	
2.	Environmental Conditions	Temperature	23°C
		Relative Humidity	50%
		Atmospheric Pressure	1019mbar
3.	Conducted Emissions Measuren	nent Uncertainty	
	All test measurements carried or	at are traceable to national standard	ds. The uncertainty of the measurement at
	a confidence level of approxima	tely 95% (in the case where distrib	outions are normal), with a coverage factor
	of 2, in the range 30MHz – 40G	Hz is $\pm 1.5$ dB.	
4.	Test date: 17th May, 2012		

Tested By : Back Huang

#### **Procedures:**

1. The EUT was connected to Spectrum Analyzer and Base Station via power divider.

2. The 99% and 26 dB occupied bandwidth (BW) of the middle channel for the highest RF powers.

#### **Test Results: Pass**

#### Cellular Band (Part 22H)

## 5.5 §2.1051, §22.917(a) & §24.238(a) - Spurious Emissions at Antenna Terminals

Conducted Measurement
 EUT was set for low, mid, high channel with modulated mode and highest RF output power.
 The spectrum analyzer was connected to the antenna terminal.
 Conducted Emissions Measurement Uncertainty
 All test measurements carried out are traceable to national standards. The uncertainty of the measurement at
 a confidence level of approximately 95% (in the case where distributions are normal), with a coverage factor
 of 2, in the range 30MHz – 40GHz is ±1.5dB.

 Environmental Conditions
 Temperature
 23°C
 Relative Humidity

Relative Humidity Atmospheric Pressure 23°C 50% 1019mbar

4. Test date : 17th May , 2012 Tested By : Back Huang

#### **Standard Requirement:**

The power of any emission outside of the authorized operating frequency ranges must be lower than the transmitter power (P) by a factor of at least  $43 + 10 \log (P) dB$ .

#### **Procedures:**

1. The EUT was connected to Spectrum Analyzer and Base Station via power divider.

2. The Band Edges of low and high channels for the highest RF powers were measured. Setting RBW as roughly BW/100.

#### **Test Result: Pass**

Refer to the attached plots.

#### Cellular Band (Part 22H)

#### PCS Band (Part24E)

## 5.6 §2.1053, §22.917 & §24.238 - Spurious Radiated Emissions

- 1. All possible modes of operation were investigated. Only the 6 worst case emissions measured, using the correct CISPR detectors, are reported. All other emissions were relatively insignificant.
- 2. A "-ve" margin indicates a PASS as it refers to the margin present below the limit line at the particular frequency.
- 3. Radiated Emissions Measurement Uncertainty All test measurements carried out are traceable to national standards. The uncertainty of the measurement at a confidence level of approximately 95% (in the case where distributions are normal), with a coverage factor of 2, in the range 1GHz – 40GH is ±6.0dB (for EUTs < 0.5m X 0.5m X 0.5m). 23°C
- **Environmental Conditions** Temperature 4. **Relative Humidity** Atmospheric Pressure 5.
- Test date : 18th May, 2012 Tested By : Back Huang

#### **Standard Requirement:**

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitter power (P) by a factor of at least  $43 + 10 \log (P) dB$ . The spectrum is scanned from 30 MHz up to a frequency including its 10<sup>th</sup> harmonic.

#### **Procedures:**

Equipment was setup in a semi-anechoic chamber. For measurements above 1 GHz an average measurement was taken with a 10Hz video bandwidth. The EUT was tested at low, mid and high with the highest output power. An emission was scan up to  $10^{th}$  harmonic of the operating frequency.

Sample Calculation:

EUT Field Strength = Raw Amplitude ( $dB \mu V/m$ ) – Amplifier Gain (dB) + Antenna Factor (dB) + Cable Loss (dB) + Filter Attenuation (dB, if used)

Test Result: Pass

## 5.8 §2.1055, §22.355 & §24.235 - Frequency Stability

1.	Environmental Conditions

Temperature Relative Humidity Atmospheric Pressure 23°C 50% 1019mbar

#### 2. Test date : 17th May , 2012 Tested By : Back Huang

#### **Standard Requirement:**

According to §22.355, the carrier frequency of each transmitter in the Public Mobile Services must be maintained within the tolerances given in Table below:

Frequency Range (MHz)	Base, fixed (ppm)	Mobile ≤3 watts (ppm)	Mobile ≤ 3 watts (ppm)
25 to 50	20.0	20.0	50.0
50 to 450	5.0	5.0	50.0
450 to 512	2.5	5.0	5.0
821 to 896	1.5	2.5	2.5
928 to 929.	5.0	N/A	N/A
929 to 960.	1.5	N/A	N/A
2110 to 2220	10.0	N/A	N/A

Frequency Tolerance for Transmitters in the Public Mobile Services

According to \$24.235, the frequency stability shall be sufficient to ensure that the fundamental emissions stay within the authorized frequency block.

#### **Procedures:**

A communication link was established between EUT and base station. The frequency error was monitored and measured by base station under variation of ambient temperature and variation of primary supply voltage.

Limit: The frequency stability of the transmitter shall be maintained within  $\pm 0.00025\%$  ( $\pm 2.5$ ppm) of the center frequency.

**Test Results: Pass** 

Report No: 12050036-FCC-R1 Issue Date: 4th July, 2012 Page: 28 of 37 www.siemic.com.cn

**Frequency Stability versus Temperature:** The Frequency tolerance of the carrier signal shall be maintained within 2.5ppm of the operating frequency over a temperature variation of -10 C to +55 C at normal supply voltage.

#### Annex A. ii. **RADIATED EMISSIONS TEST DESCRIPTION**

#### **EUT Characterisation**

Title:

EUT characterisation, over the frequency range from 30MHz to 1GHz (for FCC tests, until the 10<sup>th</sup> harmonic for operating frequencies > 108MHz),, was done in order to minimise radiated emissions testing time while still maintaining high confidence in the test results.

The EUT was placed in the chamber, at a height of about 0.8m on a turntable. Its radiated emissions frequency profile was observed, using a spectrum analyzer /receiver with the appropriate broadband antenna placed 3m or 10m away from the EUT. Radiated emissions from the EUT were maximised by rotating the turntable manually, changing the antenna polarisation and manipulating the EUT cables while observing the frequency profile on the spectrum analyzer / receiver. Frequency points at which maximum emissions occurred, clock frequencies and operating frequencies were then noted for the formal radiated emissions test at the Open Area Test Site (OATS) or EMC 3m chamber.

#### Test Set-up

- 1. The EUT and supporting equipment were set up in accordance with the requirements of the standard on top of a 1.5m X 1.0m X 0.8m high, non-metallic table.
- 2. The filtered power supply for the EUT and supporting equipment were tapped from the appropriate power sockets located on the turntable.
- 3. The relevant broadband antenna was set at the required test distance away from the EUT and supporting equipment boundary.

Report No: 12050036-FCC-R1 Issue Date: 4th July, 2012 Page: 31 of 37 www.siemic.com.cn

#### Test Method

The following procedure was performed to determine the maximum emission axis of EUT:

- 1. With the receiving antenna is H polarization, rotate the EUT in turns with three orthogonal axes to determine the axis of maximum emission.
- 2. With the receiving antenna is V polarization, rotate the EUT in turns with three orthogonal axes to determine the axis of maximum emission.
- 3. Compare the results derived from above two steps. So, the axis of maximum emission from EUT was determined and the configuration was used to perform the final measurement.

Final Radiated Emission Measurement

- 1. Setup the configuration according to figure 1. Turn on EUT and make sure that it is in normal function.
- 2. For emission frequencies measured below 1 GHz, a pre-scan is performed in a shielded chamber to determine the accurate frequencies of higher emissions will be checked on a open test site or EMC 10m chamber. As the same purpose, for emission frequencies measured above 1 GHz, a pre-scan also be performed with a 1 meter measuring distance before final test.
- 3. For emission frequencies measured below and above 1 GHz, set the spectrum analyzer on a 100 kHz and 1 MHz resolution bandwidth respectively for each frequency measured in step 2.
- 4. The search antenna is to be raised and lowered over a range from 1 to 4 meters in horizontally polarized orientation. Position the highness when the highest value is indicated on spectrum analyzer, then change the orientation of EUT on test table over a range from 0 ° to 360 ° with a speed as slow as possible, and keep the azimuth that highest emission is indicated on the spectrum analyzer. Vary the antenna position again and record the highest value as a final reading.
- 5. Repeat step 4 until all frequencies need to be measured were complete.

6. Repeat step 5 with search antenna in vertical polarized orientations.

During the radiated emission test, the Spectrum Analyzer was set with the following configurations:

Frequency Band	Function	Resolution bandwidth	Video Bandwidth
(MHz)			
30 to 1000	Peak	100 kHz	100 kHz
Above 1000	Peak	1 MHz	1 MHz
Above 1000	Average	1 MHz	10 Hz

#### **Description of Radiated Emission Program**

This EMC Measurement software run LabView automation software and offers a common user interface for electromagnetic interference (EMI) measurements. This software is a modern and powerful tool for controlling and monitoring EMI test receivers and EMC test systems. It guarantees reliable collection, evaluation, and documentation of measurement results. Basically, this program will run a pre-scan measurement before it proceeds with the final measurement. The pre-scan routine will run the scan on four different antenna heights, 2 antenna polarity, and 360 degrees table rotation. For example, the program was set to run 30 MHz to 1 GHz scan; the program will first start from a meter antenna height and divide the 30 MHz to 1 GHz into 10 separate parts of maximum hold sweeps. Each parts of maximum hold sweep, the program will collect the data from 0 degree to 360 degrees table rotation. After the program complete the 1m scan, the antenna continues to rise to 2m and continue the scan. The step will repeated for all specified antenna height and polarity. This program will perform the Quasi Peak measurement after the signal maximization process and pre-scan routine. The final measurement will be base on the pre-scan data reduction result.

#### Sample Calculation Example

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. For the limit is employed average value, therefore the peak value can be transferred to average value by subtracting the duty factor. The basic equation with a sample calculation is as follows: Peak = Reading + Corrected Factor

where

Corr. Factor = Antenna Factor + Cable Factor - Amplifier Gain (if any) And the average value is

Average = Peak Value + Duty Factor or Set RBW = 1MHz, VBW = 10Hz.

Note:

If the measured frequencies are fall in the restricted frequency band, the limit employed must be quasi peak value when frequencies are below or equal to 1 GHz. And the measuring instrument is set to quasi peak detector function.

## Annex B. EUT AND TEST SETUP PHOTOGRAPHS

Please see the attachment

Report No: 12050036-FCC-R1 Issue Date: 4th July, 2012 Page: 33 of 37 www.siemic.com.cn

## Annex C. TEST SETUP AND SUPPORTING EQUIPMENT

### **EUT TEST CONDITIONS**

#### Annex C. i. SUPPORTING EQUIPMENT DESCRIPTION

The following is a description of supporting equipment and details of cables used with the EUT.

### **Block Configuration Diagram for Radiated Emissions**

Report No: 12050036-FCC-R1 Issue Date: 4th July, 2012 Page: 35 of 37 www.siemic.com.cn

### Annex C.ii. EUT OPERATING CONDITIONS

The following is the description of how the EUT is exercised during testing.

Test	Description Of Operation
Emissions Testing	The EUT was communicating with base station and set to work at maximum output power.
Others Testing	The EUT was communicating with base station and set to work at maximum output power.

Report No: 12050036-FCC-R1 Issue Date: 4th July, 2012 Page: 36 of 37 www.siemic.com.cn

## Annex D. USER MANUAL / BLOCK DIAGRAM / SCHEMATICS / PART LIST

Please see attachment
