RF Exposure evaluation

FCC ID: ZUK-KB812M

According to 447498 D01 General RF Exposure Guidance v05

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at

test separation distances ≤ 5 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW)/(min. test

separation distance, mm)] • [$\sqrt{f(GHz)}$] ≤ 3.0 for 1-g SAR and ≤ 7.5 for

10-g extremity SAR, where

  f(GHz) is the RF channel transmit frequency in GHz

   Power and distance are rounded to the nearest mW and mm before

calculation

   The result is rounded to one decimal place for comparison

$eirp = pt \times gt = (E \times d)^2/30$

where:

pt = transmitter output power in watts,

gt = numeric gain of the transmitting antenna (unitless),

E = electric field strength in V/m, --- $10^{((dBuV/m)/20)}/10^6$

d = measurement distance in meters (m)---3m

$Sopt = (E \times d)^2/30 \times gt$

Field strength =97.75dBuV/m @3m

Ant gain =1.76dBi;so Ant numeric gain=1.5

So $pt = \{ [10^{(97.75/20)}/10^6 \times 3]^2/30\} \times 1000$ mW =1.79mW

So (1.79mW/5mm)x $\sqrt{2.448GHz}$ =0.56<3

Then SAR evaluation is not required
