## GENERAL INFORMATION

**Applicant / Company:** Shenzhen Reflying Electronic Co., Ltd  
6 Bldg, GaoXinJian Industrial zone, HePing village,  
Fuyong Town, Bao'an district, Shenzhen, Guangdong,  
China.

**Equipment Under Test (EUT):**

Product Description: Dual Charge Power Bank  
Model: AW002-PB, RPB65  
Brand Name: NA  
Nominal operating frequency 550KHz  
Maximum RF energy generated 2W

**Sample Receipt Date:** 19 January 2018  
**Test Conducted Date:** 19 January 2018 to 31 January 2018  
**Issue Date:** 01 February 2018  
**Test Site and Location:** Intertek Testing Services Shenzhen Ltd. Longhua Branch  
1F/2F, Building B, QiaoAn Scientific Technology Park,  
Shangkeng Community, Guanhu Subdistrict, Longhua District, Shenzhen, P.R. China

**Environmental Conditions:** Temperature: +10 to 40 °C  
Humidity: 10 to 90%

## **EXHIBIT 2**

### **GENERAL DESCRIPTION**

## 2.0 General Description

### 2.1 Product Description

The Equipment Under Test (EUT) is a Dual Charge Power Bank operating at 550 kHz. The EUT designed to work with client devices is incapable of transmitting any form of intelligent communication wirelessly. The EUT is powered by two DC 3.7V, 2600mAh rechargeable battery which can be charged by USB port. For more detailed features description, please refer to the user's manual.

The Model: RPB65 is the same as the Model: AW002-PB in hardware and electronic aspect. The difference in model number and appearance serve as marketing strategy.

For electronic filing, the brief circuit description is saved with filename: descri.pdf.

### 2.2 Related Submittal(s) Grants

This is an application for certification of a wireless charger. And related report for FCC SDOC is subjected to report number: 180119020SZN-001.

### 2.3 Test Methodology

Both AC mains line-conducted and radiated emission measurements were performed according to the FCC procedures in MP-5, "Methods of Measurements of Radio Noise Emissions from Industrial, Scientific and Medical equipment (February 1986)", Radiated emission measurement was performed in Semi-anechoic chamber and conducted emission measurement was performed in shield room. For radiated emission measurement, preliminary scans were performed in the semi-anechoic chamber only to determine the worst case modes. All radiated tests were performed at an antenna to EUT distance of 3 meters, unless stated otherwise in the "**Justification Section**" of this Application.

### 2.4 Test Facility

The Semi-Anechoic chamber and shield room used to collect the radiated data and conducted data are Intertek **Testing Services Shenzhen Ltd. Longhua Branch** and located at 1F/2F, Building B, QiaoAn Scientific Technology Park, Shangheng Community, Guanhu Subdistrict, Longhua District, Shenzhen, P.R. China. This test facility and site measurement data have been fully placed on file with File Number: CN1188.

## **EXHIBIT 3**

### **SYSTEM TEST CONFIGURATION**

### 3.0 System Test Configuration

#### 3.1 Justification

The system was configured for testing in a typical fashion (as a customer would normally use it), and in the confines as outlined in MP5-1986.

The EUT was powered by two DC 3.7V, 2600mAh rechargeable battery which was charged by DC 5V, 2.1A with an adapter during the test. Only the worst case data was shown in the report.

For maximizing emissions below 30 MHz, the EUT was rotated through 360°, the centre of the loop antenna was placed 1 meter above the ground, and the antenna polarization was changed. This step by step procedure for maximizing emissions led to the data report in Exhibit 4.0.

The rear of unit shall be flushed with the rear of the table.

The equipment under test (EUT) was configured for testing in a typical fashion (as a customer would normally use it). The EUT was mounted to a plastic stand if necessary and placed on the styrene turntable, which enabled the engineer to maximize emissions through its placement in the three orthogonal axes.

#### 3.2 EUT Exercising Software

N/A.

#### 3.3 Special Accessories

There are no special accessories necessary for compliance of this product.

#### 3.4 Measurement Uncertainty

When determining of the test conclusion, the Measurement Uncertainty of test has been considered.

Uncertainty and Compliance - Unless the standard specifically states that measured values are to be extended by the measurement uncertainty in determining compliance, all compliance determinations are based on the actual measured value.

#### 3.5 Equipment Modification

Any modifications installed previous to testing by Shenzhen Reflying Electronic Co., Ltd will be incorporated in each production model sold / leased in the United States.

No modifications were installed by Intertek Testing Services Shenzhen Ltd. Longhua Branch.

### 3.6 Support Equipment List and Description

This product was tested in the following configuration:

Refer List:

| Description                    | Manufacturer | Detail                                                                   |

| Dummy load                     | N/A          | 2.5Ω                                                                     |

## **EXHIBIT 4**

### **MEASUREMENT RESULTS**

## 4.0 Measurement Results

Data is included of the worst case configuration (the configuration which resulted in the highest emission levels). A sample calculation, configuration photographs and data tables of the emissions are included.

### 4.1 Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any), Average Factor (optional) from the measured reading. The basic equation with a sample calculation is as follows:

$$FS = RA + AF + CF - AG - AV$$

where

- FS = Field Strength in dB $\mu$ V/m
- RA = Receiver Amplitude (including preamplifier) in dB $\mu$ V
- CF = Cable Attenuation Factor in dB
- AF = Antenna Factor in dB
- AG = Amplifier Gain in dB
- AV = Average Factor in dB

In the following table(s), the reading shown on the data table reflects the preamplifier gain. An example for the calculations in the following table is as follows:

$$FS = RR + LF$$

where

- FS = Field Strength in dB $\mu$ V/m
- RR = RA - AG - AV in dB $\mu$ V
- LF = CF + AF in dB

Assume a receiver reading of 52.0 dB $\mu$ V is obtained. The antenna factor of 7.4 dB and cable factor of 1.6 dB are added. The amplifier gain of 29 dB and average factor of 5 dB are subtracted, giving a field strength of 27 dB $\mu$ V/m. This value in dB $\mu$ V/m was converted to its corresponding level in  $\mu$ V/m.

|                               |                      |
|-------------------------------|----------------------|
| RA = 52.0 dB $\mu$ V/m        |                      |
| AF = 7.4 dB                   | RR = 18.0 dB $\mu$ V |
| CF = 1.6 dB                   | LF = 9.0 dB          |
| AG = 29.0 dB                  |                      |
| AV = 5.0 dB                   |                      |
| FS = RR + LF                  |                      |
| FS = 18 + 9 = 27 dB $\mu$ V/m |                      |

$$\text{Level in } \mu\text{V/m} = \text{Common Antilogarithm } [(27 \text{ dB}\mu\text{V/m})/20] = 22.4 \mu\text{V/m}$$

#### 4.2 Radiated Emission Configuration Photograph

For electronic filing, the worst case radiated emission configuration photographs are saved with filename: radiated photos.pdf.

#### 4.3 Radiated Spurious Emission

Worst Case Radiated Spurious Emission  
at  
0.063MHz

Judgement: Passed by 8.7dB margin

For the electronic filing, the worst case radiated emission configuration photographs are saved with filename: radiated photos.pdf.

Applicant: Shenzhen Reflying Electronic Co., Ltd

Date of Test: January 31, 2018

Model: AW002-PB

Worst Case Operating Mode: Charging and power transfer

### Radiated Emissions

| Polarization | Frequency (MHz) | Reading (dBμV) | Pre-Amp Gain (dB) | Antenna Factor (dB) | Net at 3m (dBμV/m) | Limit at 3m (dBμV/m) | Margin (dB) |
|--------------|-----------------|----------------|-------------------|---------------------|--------------------|----------------------|-------------|
| Horizontal   | 0.010           | 33.1           | 0.0               | 20.8                | 53.9               | 63.5                 | -9.6        |
| Horizontal   | 0.036           | 37.1           | 0.0               | 16.8                | 53.9               | 63.5                 | -9.6        |
| Horizontal   | 0.063           | 38.4           | 0.0               | 16.4                | 54.8               | 63.5                 | -8.7        |
| Horizontal   | 0.127           | 31.0           | 0.0               | 16.3                | 47.3               | 63.5                 | -16.2       |
| Horizontal   | 0.187           | 37.3           | 0.0               | 16.4                | 53.7               | 63.5                 | -9.8        |
| Horizontal   | 0.251           | 31.2           | 0.0               | 16.1                | 47.3               | 63.5                 | -16.2       |
| Horizontal   | 0.550           | 34.6           | 0.0               | 17.8                | 52.4               | 63.5                 | -11.1       |

Notes: 1. Peak Detector Data unless otherwise stated.

2. All measurements were made at 3 meter. Harmonic emissions not detected at the 3-meter distance were measured at 0.3-meter and an inverse proportional extrapolation was performed to compare the signal level to the 3-meter limit. No other harmonic emissions than those reported were detected at a test distance of 0.3-meter.

3. Negative value in the margin column shows emission below limit.

4. Loop antenna is used for the emission under 30MHz.

5. Limits at 3 meter for radiated emissions below 30 MHz is converted from the Limits at 300 meter according to the Formula:

$$\text{Limits at 3 meter (dB}\mu\text{V/m)} = \text{Limits at 30 meter (dB}\mu\text{V/m)} + 20 \log(300/3)$$

6. Other emissions more than 20dB below the limit are not reported.

7. The measurement uncertainty is  $\pm 4.8\text{dB}$  at a level of confidence of 95%.

#### 4.4 Conducted Emission Configuration Photograph

For electronic filing, the worst case radiated emission configuration photographs are saved with filename: conducted photos.pdf.

#### 4.5 Conducted Emission

Worst Case Conducted Configuration  
at  
0.650MHz

Judgement: Passed by 13.2dB margin

Applicant: Shenzhen Reflying Electronic Co., Ltd

Date of Test: January 31, 2018

Model: AW002-PB

Worst Case Operating Mode: Charging and power transfer

Phase: Live

## Graphic / Data Table

### Conducted Emissions Pursuant to FCC 18.307: Emissions Requirement

Note: The measurement uncertainty is  $\pm 3.6$ dB at a level of confidence of 95%.

Applicant: Shenzhen Reflying Electronic Co., Ltd

Date of Test: January 31, 2018

Model: AW002-PB

Worst Case Operating Mode: Charging and power transfer

Phase: N

## Graphic / Data Table

### Conducted Emissions Pursuant to FCC 18.307: Emissions Requirement

### Limit and Margin QP

| Frequency (MHz) | QuasiPeak (dB $\mu$ V) | Bandwidth (kHz) | Line | Corr. (dB) | Margin (dB) | Limit (dB $\mu$ V) |
|-----------------|------------------------|-----------------|------|------------|-------------|--------------------|

### **MISCELLANEOUS INFORMATION**

## 9.0 Miscellaneous Information

This miscellaneous information includes emission measuring procedure.

### 9.1 Emissions Test Procedures

The following is a description of the test procedure used by Intertek Testing Services in the measurements of Industrial, Scientific and Medical equipment operating under FCC methods of measurements of radio noise emissions from Industrial, Scientific and Medical equipment.

Initial measurements are made near the EUT with the measuring antenna 3 meters from the nearest part of the EUT. The dummy load specified in Sections 3.6 is used, as applicable. The EUT is rotated about its horizontal axis on the turntable, and the polarization and height of the receiving antenna are varied to obtain the highest field strength on the particular frequency under observation. Measurements at the 3 meter distance are made in a large room or outdoors; with the equipment and antenna located so as to minimize effects due to reflections from the building structure or other items in the field. For measurements above ICE: and at 3 meters, an antenna of small aperture (i.e. , a small horn, without its reflector) is used, because the field over the area of a large antenna would be non-uniform, and such an antenna would not have the gain normally expected.

At each test frequency, the reading of the field strength meter is observed during the heating cycle as the following factors are varied:

- (1) EUT orientation;
- (2) Antenna orientation;
- (3) Antenna polarization

## 9.2 Radiated Emission Test Setup

The figure below shows the test setup, which is utilized to make these measurements.

## 9.3 Conducted Emission Test Configuration

Conducted emissions test

Measurements of powerline conducted radio noise shall be expressed as the voltage developed across the 50-ohm port terminated by a 50-ohm measuring instrument. All voltage measurement shall be made at the plug end of the EUT power cord, e.g., by the use of mating plugs and receptacles on the EUT and LISN.

## 9.4 Conducted Emission Test Setup

**EXHIBIT 10**

**CONFIDENTIALITY REQUEST**

## 10.0 Confidentiality Request

For electronic filing, the confidentiality request of the tested EUT is saved with filename: request.pdf.
